RAM — Responsibility Assignment Module

OriginID: OOF-OID-GOV-SESCS-RAM-2026-04-09-0001
Category: Governance & Enforcement
Module: Responsibility Assignment Module (RAM)
Type: Accountability & Liability Module

Standard: Self-Evolving Systems Control Standard (SESCS)
Version: 1.0
Status: Canonical Module
Effective Date: 9 April 2026

Authority: OOF™ Origin Open Foundation™
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL™)

Compatibility:
SESCS · MCM · MLM · MVM · TSA · MTVF · EVIP · ArtData · AI Governance Systems · ORGS

Canonical Definition System

Responsibility Assignment Module (RAM) defines the mandatory assignment of responsibility for every system mutation, decision, and outcome within a self-evolving system.

Base

Without responsibility:

- actions cannot be attributed
- liability cannot be enforced
- systems operate without accountability
- risk becomes unassignable

A system without responsibility is not governable.

Protocol

Every mutation, execution, and decision MUST:

- have an assigned responsible entity
- be traceable to its origin
- be attributable to a decision source

Absence of responsibility results in:
Unassigned Responsibility State (URS)

Scope

RAM applies to:

- AI-generated decisions
- system mutations
- autonomous execution flows
- multi-agent interactions
- hybrid human-AI systems

Methodology

1. identify action or mutation
2. identify origin entity
3. assign responsibility
4. link responsibility to action
5. store responsibility mapping

Responsibility Types

---

1. Human Responsibility

- operator
- developer
- system owner

---

2. System Responsibility

- AI agent
- autonomous system

---

3. Hybrid Responsibility

- human-approved AI action
- shared decision-making

Structural Rule (Critical)

No system action is valid without assigned responsibility.

Attribution Requirement

Each action MUST include:

- responsible entity
- decision origin
- execution context

MIF — Minimal Implementation Framework

Step 1 — Action Identification

Identify system action or mutation.
Minimum:

- action defined

Step 2 — Entity Assignment

Assign responsible entity.

Minimum:

- human / system / hybrid

Step 3 — Mapping

Link entity to action.

Minimum:

- traceable mapping

Step 4 — Storage

Store responsibility record.

Minimum:

- persistent and accessible

MIF+ — Extended Implementation Framework

Includes all MIF requirements plus:

- multi-entity responsibility mapping
- hierarchical responsibility structures
- legal liability integration
- automated responsibility assignment systems
- cross-system responsibility tracking
- integration with MLM logs and TSA states

Decision Logic

Responsibility state is:

> **ASSIGNED** → valid
> **UNASSIGNED** → invalid

Use Case 1 — AI Decision Impact

Scenario

AI system makes a decision affecting users or operations.

Problem

- unclear responsibility
- no accountability

Application

RAM assigns:

- system responsibility
- human oversight where applicable

Result

- accountability established
- decisions traceable
- liability definable

Use Case 2 — System Mutation Failure

Scenario

System mutation causes failure or damage.

Problem

- no clear source of responsibility
- legal ambiguity

Application

RAM ensures:

- mutation origin linked to entity
- responsibility traceable

Result

- clear accountability
- legal clarity
- enforceable responsibility

Compatibility

RAM operates with:

- MCM — defines mutation boundaries
- MLM — provides traceability
- MVM — validates actions
- RIM — enables rollback
- TSA — trust classification
- MTVF — validation logic

Structural Principle

A system without responsibility is a system without control.

Closing Statement

Actions without responsibility create uncontrolled systems.
Uncontrolled systems create systemic risk.

Responsibility Assignment Module (RAM) establishes a non-negotiable condition:

Every action must have a responsible entity.
