Digital Value Interaction Standard (DVIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-INT-DVIS-2026-04-04-0001
Category: Economic & Value
Subcategory: Digital Value Systems
Type: Value Definition Standard.
Version: 1.0
Status: Canonical · Open Standard
Effective Date: 4 April 2026

Compatibility:

- OOF™ Methodology OS
- Value Flow Mechanism
- Audit in Real Time

Authority: OOF™ Origin Open Foundation™
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English

A. Standard Abstract

The Digital **Value Interaction Standard (DVIS)** defines how value is identified, classified, and recognized within digital systems.

The objective is to establish a clear structural distinction between:

- interaction
- perceived value
- actual value movement

This standard does not regulate platforms, behavior, or monetization models.

It defines **what constitutes value within digital environments.**

B. Canonical Definition

A Digital Value Interaction is any action within a digital system that:

- generates a signal of value
- contributes to value perception
- or results in measurable value movement

Not all interactions create value.

Only interactions resulting in value movement create **transactional reality.**

C. Structural Base

This standard is based on:

- Value Signal vs Value Event Separation
- Measurable Value Principle
- Non-Assumption Rule
- System-Independent Logic

Value must be defined, not assumed.

D. Core Classification

DVIS defines two mutually exclusive interaction states:

---

1. Value Signal

A Value Signal is an interaction that:

- indicates attention or interest
- contributes to perceived value
- does not transfer measurable value

---

2. Value Event

A Value Event is an interaction that:

- results in measurable value movement
- creates economic or structural impact
- can be recorded, attributed, and audited

E. E. Structural Rule

Only Value Events constitute:

Digital Transactions

Value Signals do not.

F. Transaction Definition (Critical)

A Digital Transaction exists only when:

- value is transferred
- value is measurable
- value is attributable

If any of these conditions are not met:

→ no transaction exists

G. Non-Equivalence Rule

Value Signals MUST NOT be:

- treated as transactions
- interpreted as value transfer
- used as a proxy for economic value

H. System Independence

This standard applies regardless of:

- platform
- technology
- currency
- monetization model

Value logic remains constant across all systems.

I. Methodology

This standard applies regardless of:

1. Identify the interaction
2. Determine whether value is signaled or transferred
3. If value is transferred → classify as Value Event
4. If not → classify as Value Signal

K. Structural Principle

Attention is not value.
Only transferred value defines reality.

Canonical Closing Statement

Digital systems generate infinite interaction.
Only a fraction creates real value.

Digital Value Interaction Standard (DVIS) establishes a non-negotiable condition: **value must be defined by movement, not perception.**

Not every interaction creates value.
Only value movement creates a transaction.
