Collective Memory Accountability Module (CMAM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-MEM-CMAM-2026-06-12-0005
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Memory Governance Intelligence Architecture (MGIA™)
Operational Layer: Collective Memory Governance Layer
Governed Space: Collective Memory Accountability Integrity
Category: AI & Interpretation
Subcategory: Collective Memory Accountability Governance
Type: Collective Memory Integrity Module
Parent Standard: Collective Memory Integrity Standard (CMIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 12 June 2026
Compatibility: OOF Methodology OS · Collective Memory Integrity Standard (CMIS) · Collective Knowledge Integrity Module (CKIM) · Collective Recall Integrity Module (CRIM) · Memory Accountability Integrity Module (MAIM) · Memory Governance Standard (MGS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Collective Memory Accountability Module (CMAM) defines the structural conditions under which creation, preservation, modification, transfer, retrieval, interpretation, utilization, and governance of collective memory remain attributable, traceable, reviewable, governable, and operationally accountable throughout the collective memory lifecycle.

CMAM governs collective memory accountability.

The module ensures that actions affecting collective memory remain linked to identifiable actors, institutions, governance mechanisms, and accountable decision processes.

A system satisfies CMAM only if:

- collective-memory actions remain attributable
- accountability relationships remain visible
- governance oversight remains assessable
- responsibility remains identifiable
- collective-memory modifications remain reviewable
- accountability remains operationally valid

A collective-memory environment that cannot explain who changed, preserved, interpreted, or governed collective memory does not satisfy CMAM.

Module Operational Role

CMAM defines the accountability-governance layer of CMIS.
Its role is to preserve accountability throughout collective memory operation.

Module Operational Space

CMAM governs:

- collective-memory accountability
- memory stewardship
- responsibility attribution
- collective governance
- memory oversight
- accountability preservation
- traceability of memory actions
- collective-memory governance

The module applies wherever collective memory is created, preserved, or utilized.

Module Function

The module applies wherever systems must preserve:

- accountable memory stewardship
- visible governance structures
- traceable memory modifications
- governance-valid preservation
- trustworthy collective continuity
- transparent collective intelligence environments

Its function is to ensure that collective memory remains linked to accountable governance
and accountable decision-making.

Minimum Implementation Framework

1. Define the Collective Memory Accountability Object

The organization must define which collective-memory activities require accountability governance.

This may include:

- memory creation
- memory preservation
- memory modification
- memory interpretation
- memory transfer
- memory retrieval
- archival activities
- Human-AI collective-memory operations

2. Define Collective Memory Accountability Conditions

The system must define the conditions under which accountability remains valid.

This includes:

- attribution requirements
- governance requirements
- oversight requirements
- traceability requirements
- reviewability requirements
- accountability-valid conditions

3. Define Accountability Degradation Detection Logic

The system must define how accountability degradation is identified.

This may include:

- anonymous memory modifications
- undocumented historical revisions
- governance-blind preservation
- accountability gaps
- stewardship failures
- unverifiable collective-memory actions

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-integrity failures.

Governance response may include:

- accountability review
- attribution verification
- governance intervention
- escalation
- corrective actions
- stewardship reassignment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- memory actions
- stewardship activities
- governance reviews
- intervention procedures
- accountability assignments
- resulting memory states

A collective-memory environment must not remain accountability-valid if materially significant collective-memory activities cannot be attributed, reconstructed, reviewed, or governed.

Use Case 1 — National Historical Preservation Authority

Scenario

A national institution maintains archives, legal records, historical documents, and collective cultural memory over many generations.

Application

CMAM governs accountability of preservation, modification, interpretation, and stewardship activities.

Result

The institution gains stronger transparency, improved trustworthiness, and reduced exposure to unmanaged historical revision.

Use Case 2 — Global Human-AI Knowledge Infrastructure

Scenario

Humans and AI systems jointly preserve and govern collective scientific, educational, operational, and governance knowledge.

Application

CMAM governs accountability of collective-memory stewardship and governance decisions.

Result

The ecosystem gains stronger auditability, improved governance visibility, and reduced exposure to unaccountable memory manipulation.

Canonical Closing Statement

Collective Memory Accountability Module (CMAM) defines the structural conditions under which creation, preservation, modification, transfer, retrieval, interpretation, utilization, and governance of collective memory remain attributable, traceable, reviewable, governable, and operationally accountable throughout the collective memory lifecycle.

Collective memory cannot remain trustworthy if nobody is accountable for preserving, modifying, interpreting, or governing it. Collective memory accountability therefore becomes a foundational integrity condition of trustworthy civilization-scale memory and collective intelligence systems.
