RCSIM — Responsibility Continuity Scope Integrity Module

OriginID: OOF-OID-AGA-RCSIM-2026-06-17-0062Architecture **Ecosystem:** Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Responsibility Continuity Governance Layer
Governed Space: Responsibility Continuity Scope Integrity
Category: Governance & Enforcement
Subcategory: Responsibility Continuity Governance
Type: Responsibility Continuity Standard Module
Parent Standard: Responsibility Continuity Standard (RCS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 17 June 2026
Compatibility: OOF Methodology OS · Responsibility Continuity Standard (RCS) · Responsibility Governance Standard (RGS) · Responsibility Assignment Standard (RAS-A) · Responsibility Traceability Standard (RTS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Responsibility Continuity Scope Integrity Module (RCSIM) defines the structural conditions under which preserved responsibilities, continuity boundaries, continuity obligations, continuity duties, continuity expectations, continuity limitations, and continuity outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the responsibility lifecycle.

RCSIM governs responsibility-continuity scope.

The module establishes the integrity conditions required to determine exactly what responsibility remained preserved, what continuity obligations survived operational changes, where continuity boundaries begin, and where continuity boundaries end.

Module Operational Role

RCSIM defines the continuity-scope governance layer of RCS.

Its role is to preserve visibility of responsibility-preservation boundaries and continuity coverage.

Module Operational Space

RCSIM governs:

- continuity scope
- continuity boundaries
- preserved responsibilities
- continuity obligations
- continuity duties
- continuity limitations
- continuity expectations
- continuity coverage

The module applies wherever governance requires clarification of responsibility-preservation boundaries.

Module Function

The module applies wherever systems must preserve:

- clearly defined continuity boundaries
- visible continuity coverage
- reconstructable continuity domains
- accountable continuity structures
- governance-valid continuity limits
- operational continuity clarity

Its function is to ensure that governance can determine exactly what responsibility remained preserved and what responsibility did not.

Minimum Implementation Framework

1. Define the Continuity Scope Object

The organization must define which continuity environments require scope governance.

This may include:

- organizational structures
- contractor networks
- project environments
- management systems
- governance frameworks
- AI governance systems
- Human-AI operational environments
- operational continuity programs

2. Define Continuity Scope Conditions

The system must define the conditions under which continuity scope remains valid.

This includes:

- continuity-boundary requirements
- preservation requirements
- obligation requirements
- responsibility requirements
- governance requirements
- continuity-scope conditions

3. Define Scope Degradation Detection Logic

The system must define how continuity-scope failures are identified.

This may include:

- continuity ambiguity
- continuity gaps
- fragmented preservation
- overlapping continuity domains
- governance-blind continuity transitions
- unclear continuity boundaries

4. Define Operational Response or Governance Logic

The system must define governance logic for continuity-scope failures.

Governance response may include:

- continuity review
- scope verification
- governance intervention
- continuity clarification
- corrective actions
- continuity reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- continuity boundaries
- preserved responsibilities
- governance reviews
- validation activities
- intervention procedures
- resulting continuity states

A responsibility-continuity environment must not remain scope-valid if materially significant continuity boundaries cannot be reconstructed, reviewed, validated, clarified, or governed.

Use Case 1 — Multi-Layer Contractor Environment

Scenario

A responsibility moves through multiple organizations and operational actors before an outcome occurs.

Application

RCSIM determines exactly which responsibilities remained preserved throughout the operational chain and identifies continuity boundaries.

Result

Governance gains visibility into continuity coverage and continuity limitations.

Use Case 2 — Human-AI Operational Environment

Scenario

Responsibilities pass through humans, orchestration systems, AI agents, and governance actors during execution.

Application

RCSIM determines which responsibilities remained preserved throughout operational transitions and where continuity boundaries exist.

Result

Governance gains visibility into responsibility continuity across intelligent operational ecosystems.

Canonical Closing Statement

Responsibility Continuity Scope Integrity Module (RCSIM) defines the structural conditions under which preserved responsibilities, continuity boundaries, continuity obligations, continuity duties, continuity expectations, continuity limitations, and continuity outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the responsibility lifecycle.

Responsibility continuity cannot be preserved if continuity boundaries are unclear. Responsibility Continuity Scope Integrity therefore becomes a foundational condition of trustworthy responsibility continuity governance.
