AAM — Accountability Assignment Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GASA-AAM-2026-06-22-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Governance Architecture (GOA™)
Governance Flow Position: Authority → Boundary → Scope →
Delegation → Accountability → Validation → Integrity → Transparency →
Continuity → Interoperability
Operational Layer: Governance Accountability Layer
Governed Space: Accountability Assignment
Category: Governance & Enforcement
Subcategory: Governance Accountability Governance
Type: Governance Accountability Standard Module
Parent Standard: Governance Accountability Standard (GAS-A)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 22 June 2026
rd (GAS-A)
· Governance Delegation Standard (GDS) · Governance Validation Standard (GVS) ·
Accountability Governance Architecture (AGA™) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Compatibility: OOF Methodology OS · Governance Accountability Standa **Authority:** OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Accountability Assignment Module (AAM) defines the structural conditions under which governance-accountability assignments remain identifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

AAM governs accountability assignment.

The module establishes the foundational conditions required to determine who receives accountability, how accountability is assigned, whether accountability assignment remains legitimate, and whether accountability assignments remain reconstructable throughout operational reality.

Governance outcomes may occur.

Governance accountability must be assigned.

AAM governs that assignment.

Module Operational Role

AAM defines the accountability-assignment governance layer of GAS-A.

Its role is to establish governance-valid accountability ownership throughout governance environments.

Module Operational Space

AAM governs:

- accountability assignment
- accountability ownership
- accountability attribution
- accountability legitimacy
- accountability traceability
- accountability auditability
- accountability validation
- accountability reconstruction

The module applies wherever accountability must be assigned to governance actors.

Module Function

The module applies wherever systems must preserve:

- assigned accountability
- attributable accountability ownership
- traceable accountability relationships
- reconstructable accountability history
- governance-valid accountability records
- operational accountability visibility

Its function is to ensure that governance can identify who remains accountable for governance outcomes.

Minimum Implementation Framework

1. Define the Accountability Assignment Object

The organization must define which governance

environments require accountability-assignment governance.
This may include:

- organizations
- institutions
- governments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Accountability Assignment Conditions

The system must define the conditions under which
accountability assignments remain valid.
This includes:

- assignment requirements
- attribution requirements
- legitimacy requirements
- traceability requirements
- validation requirements
- governance-valid accountability conditions

3. Define Accountability Degradation Detection Logic

The system must define how accountability-assignment
failures are identified.
This may include:

- missing accountability ownership
- undocumented accountability assignments
- hidden accountability relationships
- accountability ambiguity
- unverifiable accountability records
- governance-invalid accountability activities

4. Define Operational Response or Governance Logic

The system must define governance logic for
accountability-assignment failures.
Governance response may include:

- accountability review
- accountability validation
- governance intervention
- corrective actions
- accountability reconstruction
- ownership verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability assignments
- accountability ownership records
- governance reviews
- intervention procedures
- validation activities
- resulting accountability states

A governance environment must not remain accountability-valid
if materially significant accountability assignments cannot be
reconstructed, reviewed, validated, attributed,
preserved, or governed.

Use Case 1 — Corporate Governance Environment

Scenario

A governance board assigns accountability for strategic
initiatives to designated executives.

Application

AAM governs accountability ownership, accountability attribution,
and accountability-assignment legitimacy.

Result

The organization gains clearer accountability ownership,
reduced accountability ambiguity, and stronger
governance oversight.

Use Case 2 — Human-AI Governance Environment

Scenario

Human governance actors deploy AI systems and must
assign accountability for resulting governance outcomes.

Application

AAM governs accountability assignment, accountability attribution,
and governance-valid accountability ownership.

Result

The organization gains stronger accountability visibility,
reduced governance ambiguity, and improved

Human-AI accountability management.

Canonical Closing Statement

Accountability Assignment Module (AAM) defines the structural conditions under which governance-accountability assignments remain identifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Governance accountability cannot exist until governance accountability has been assigned. Accountability Assignment therefore becomes a foundational condition of trustworthy governance accountability governance.
