AVIM — Accountability Validity Integrity Module

OriginID: OOF-OID-AGA-AVIM-2026-06-17-0053Architecture **Ecosystem:** Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Accountability Governance Layer
Governed Space: Accountability Validity Integrity
Category: Governance & Enforcement
Subcategory: Accountability Governance
Type: Accountability Governance Standard Module
Parent Standard: Accountability Governance Standard (AGS-A)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 17 June 2026
Compatibility: OOF Methodology OS · Accountability Governance Standard (AGS-A) · Responsibility Governance Standard (RGS) · Chain of Control Standard (CCS) · Evidence Accountability Standard (EAS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Accountability Validity Integrity Module (AVIM) defines the structural conditions under which accountability relationships remain legitimate, recognized, attributable, enforceable, governable, reconstructable, reviewable, and operationally valid throughout the accountability lifecycle.

AVIM governs accountability validity.

The module establishes the integrity conditions required to determine whether accountability remains legitimately assigned, properly recognized, operationally enforceable, governance-valid, and suitable for answerability attribution.

Module Operational Role

AVIM defines the accountability-validity governance layer of AGS-A.

Its role is to ensure that accountability remains legitimate and governance-valid throughout its lifecycle.

Module Operational Space

AVIM governs:

- accountability validity
- accountability legitimacy
- accountability recognition
- accountability enforceability
- accountability attribution validity
- answerability validity
- governance-valid accountability
- accountability lifecycle governance

The module applies wherever governance requires confirmation that accountability remains valid.

Module Function

The module applies wherever systems must preserve:

- legitimate accountability relationships
- recognized accountability assignments
- enforceable accountability structures
- reconstructable accountability history
- governance-valid accountability states
- operationally reliable answerability

Its function is to ensure that governance can determine whether accountability remains valid throughout governance activities and operational outcomes.

Minimum Implementation Framework

1. Define the Accountability Validity Object

The organization must define which accountability environments require validity governance.

This may include:

- organizational structures
- governance systems
- contractor environments
- certification systems
- regulatory systems
- AI governance systems
- Human-AI operational environments
- accountability frameworks

2. Define Accountability Validity Conditions

The system must define the conditions under which
accountability remains valid.

This includes:

- legitimacy requirements
- recognition requirements
- enforceability requirements
- attribution requirements
- governance requirements
- accountability-valid conditions

3. Define Validity Degradation Detection Logic

The system must define how accountability-validity failures
are identified.

This may include:

- invalid accountability assignments
- unenforceable accountability structures
- accountability conflicts
- governance-invalid accountability relationships
- accountability ambiguity
- answerability failures

4. Define Operational Response or Governance Logic

The system must define governance logic for
accountability-validity failures.

Governance response may include:

- accountability review
- assignment verification
- governance intervention
- accountability reassessment
- corrective actions
- accountability validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability assignments
- accountability validations
- governance reviews
- intervention procedures
- validation activities
- resulting accountability states

An accountability-governance environment must not remain validity-valid if materially significant accountability relationships cannot be reconstructed, reviewed, validated, recognized, enforced, or governed.

Use Case 1 — Multi-Layer Governance Environment

Scenario

A governance review determines whether accountability assignments across organizational layers remain legitimate and enforceable following an operational failure.

Application

AVIM evaluates whether accountability assignments remain governance-valid and answerability-capable.

Result

Governance gains visibility into the legitimacy and validity of accountability structures.

Use Case 2 — Human-AI Accountability Environment

Scenario

Multiple organizations, operators, orchestration systems, and AI agents participate in generating operational outcomes requiring accountability assessment.

Application

AVIM evaluates whether accountability assignments remain legitimate, recognized, and enforceable across intelligent operational ecosystems.

Result

Governance gains visibility into the validity of accountability relationships.

Canonical Closing Statement

Accountability Validity Integrity Module (AVIM) defines the structural conditions under which accountability relationships remain legitimate, recognized, attributable, enforceable, governable, reconstructable, reviewable, and operationally valid throughout the accountability lifecycle.

Accountability may exist, but accountability that lacks legitimacy or enforceability cannot be trusted. Accountability validity integrity therefore becomes a foundational condition of trustworthy accountability governance.
