PCM — Perception Continuity Module

Parent Standard: Operational Perception Integrity Standard (OPIS)
Category: Governance & Enforcement
Subcategory: Perception Continuity
Type: Operational Perception Integrity Module

Version: 1.0
Status: Canonical · Open Module
Effective Date: 19 May 2026

Compatibility: OOF Methodology OS · Operational Perception Integrity Standard (OPIS) · Runtime Integrity Standard (RIS) · Operational Context Integrity Standard (OCIS) · Operational Attention Governance Standard (OAGS) · Semantic Integrity Standard (SEIS) · Operational Evidence & Auditability Standard (OEAS) · INTEGROS® — Integrity Standard · Autonomous Runtime Systems · Robotics Infrastructures
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Perception Continuity Module (PCM) defines the structural conditions under which operational perception continuity, runtime sensory persistence, multimodal perception stability, distributed perception coordination, and consequence- bearing perception continuity remain materially stable, traceable, and operationally governable across runtime operational environments.

A system satisfies PCM only if:

- operational perception continuity remains materially stable
- runtime sensory persistence preserves operational alignment
- multimodal perception continuity remains coherent
- distributed perception coordination remains operationally synchronized
- perception fragmentation does not silently destabilize operational
- continuity

A system that preserves runtime execution while operational perception continuity materially fragments does not satisfy PCM.

Module Operational Role

PCM defines the perception continuity layer of OPIS by preserving stable runtime perception continuity across operational environments.

Module Operational Space

PCM governs the perception continuity space of OPIS by preserving runtime sensory persistence, multimodal perception stability, distributed perception coherence, adaptive perception continuity, and consequence-bearing operational perception across runtime systems.

Module Function

The module applies wherever systems must preserve:

- operational perception continuity
- runtime sensory persistence
- multimodal perception coherence
- distributed perception synchronization
- adaptive perception stability
- consequence-bearing perception continuity

Its function is to ensure that operational perception continuity remains materially stable strongly enough to preserve runtime operational reality alignment across execution environments.

Minimum Implementation Framework

1. Define the Perception Continuity Object

The organization must define which operational perception structures require continuity governance.

This may include:

- runtime sensory streams
- multimodal perception layers
- distributed sensing infrastructures
- realtime environmental interpretation
- adaptive perception systems
- orchestration-level perception continuity
- consequence-bearing operational sensing

---

2. Define Perception Continuity Conditions

The system must define the conditions under which operational perception continuity remains materially stable and operationally aligned.

This includes:

- runtime sensory stability
- multimodal continuity coherence
- distributed perception synchronization
- adaptive perception alignment
- operational reality persistence

3. Define Perception Fragmentation Detection Logic

The system must define how materially unstable perception continuity or perception fragmentation is identified.

This may include:

- sensory discontinuity
- multimodal instability
- distributed perception divergence
- operational reality mismatch
- consequence-bearing perception discontinuity

4. Define Operational Response or Governance Logic

The system must define governance logic for materially unstable perception continuity conditions.

Governance response may include:

- perception stabilization
- sensory synchronization
- multimodal continuity reconstruction
- adaptive perception restriction
- operational review activation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of perception continuity and perception-fragmentation states. A system must not remain perception-valid if operational perception continuity materially fragments while systems continue assuming runtime operational reality alignment remains preserved.

Use Case 1 — Autonomous Robotics Runtime

Environment

Scenario

A robotics infrastructure continuously interprets realtime operational environments through distributed sensors and multimodal runtime perception systems.

Application

PCM preserves stable operational perception continuity through runtime sensory synchronization and multimodal continuity governance.

Result

The environment gains stronger runtime operational-reality continuity and reduced hidden perception fragmentation across autonomous operational systems.

Use Case 2 — Distributed Industrial Monitoring

Infrastructure

Scenario

A distributed industrial infrastructure continuously processes environmental sensing data across adaptive runtime monitoring systems and distributed perception environments.

Application

PCM preserves governance-valid perception continuity through distributed sensory coherence and operational reality continuity stabilization.

Result

The organization gains stronger operational perception stability and reduced runtime sensory discontinuity across distributed operational infrastructures.

Canonical Closing Statement

If operational perception continuity cannot remain materially stable across runtime environments, systems may preserve operational execution while runtime operational reality silently destabilizes underneath.
