INTEGROS — Integrity Standard

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOV-INTEGROS-2026-03-05-0001
Category: Governance & Enforcement
Subcategory: Integrity Governance Frameworks
Type: Infrastructure-Level Integrity Standard
Version: 2.0
Status: Canonical · Open Standard
Effective Date: 19 March 2026

Compatibility:
OOF Methodology OS
MTVF
EVIP
ORGS (OGS-VFM Level 0)

Authority: OOF™ Origin Open Foundation™
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL™)

Canonical Definition

INTEGROS defines the non-bypassable conditions under which systems maintain integrity, traceability, and verifiability across operation.

Integrity means: a system cannot be modified, manipulated, or bypassed without detection.

If integrity cannot be enforced, the system cannot be considered valid.

A. Standard Abstract

INTEGROS operates as the infrastructure-level integrity layer within the OOF Methodology OS.

Without integrity, no system can be considered reliable, governable, or valid.

The objective is to ensure that:

- system behavior is traceable
- system logic is consistent
- manipulation is detectable
- verification is always possible

Integrity is not a feature.
It is a precondition for system existence.

B. Core Principle

Integrity must exist before any system can be trusted
or operated.

C. Core Integrity Conditions

All conditions MUST be present simultaneously.

C.1 — Traceability

Category: Core Integrity Condition
Type: Record & Attribution Requirement

All integrity-relevant actions MUST be:

- recorded
- attributable
- time-linked
- reconstructable

C.2 — Structural Consistency

Category: Core Integrity Condition
Type: Consistency & Change Control Requirement

System rules MUST:

- remain consistent across time
- record all changes
- detect all deviations

C.3 — Verification Capability

Category: Core Integrity Condition
Type: Auditability Requirement

The system MUST allow:

- independent verification
- auditability
- integrity validation

C.4 — Manipulation Detection

Category: Core Integrity Condition
Type: Detection Requirement

The system MUST detect:

- unauthorized modification
- data manipulation
- process bypass

C.5 — Integrity State Transparency

Category: Core Integrity Condition
Type: State Definition Requirement

The system MUST define observable states:

- valid
- compromised
- restored

C.6 — Chain of Control

Category: Core Integrity Condition
Type: Authority & Responsibility Requirement

The system MUST maintain:

- traceable authority
- defined responsibility
- controlled transitions

D. Prohibited Condition

No system may operate or claim validity if actions are
not traceable, manipulation cannot be detected,
or behavior cannot be verified.

Any undetectable modification invalidates system integrity.

E. Scope

Applicable to:

- data systems
- operational processes
- system architectures
- environmental systems
- AI systems

F. System Position

INTEGROS functions as the foundational integrity layer
of the OOF system architecture.

All other standards depend on its conditions.

Without integrity, no higher-level system function
can be considered valid.

G. Compatibility Statement

A system may declare:

"INTEGROS Compatible"

only if all conditions are continuously satisfied.

Structural Architecture

```
INTEGROS – Integrity Standard
        │
        ├── C.1 – Traceability
        ├── C.2 – Structural Consistency
        ├── C.3 – Verification Capability
        ├── C.4 – Manipulation Detection
        ├── C.5 – Integrity State Transparency
        └── C.6 – Chain of Control
```

Canonical Closing Statement

If integrity cannot be verified, it does not exist.
