SEM — Scope Expansion Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GSS-SEM-2026-06-22-0003
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Governance Architecture (GOA™)
Operational Layer: Governance Scope Governance Layer
Governed Space: Governance Scope Expansion
Category: Governance & Enforcement
Subcategory: Governance Scope Governance
Type: Governance Scope Standard Module
Parent Standard: Governance Scope Standard (GSS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 22 June 2026
Compatibility: OOF Methodology OS · Governance Scope Standard (GSS) · Governance Boundary Standard (GBS) · Governance Authority Standard (GAS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Scope Expansion Module (SEM) defines the structural conditions under which governance-scope expansions remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

SEM governs governance scope expansion.

The module establishes the foundational conditions required to determine when governance scope may be expanded, what new governance domains may enter governance coverage, how governance-scope growth occurs, and whether governance-scope expansions remain reconstructable throughout operational reality.

Governance scope may exist.

Governance scope may also grow.

SEM governs that expansion.

Module Operational Role

SEM defines the scope-expansion governance layer of GSS.

Its role is to establish governance-valid scope growth throughout governance environments.

Module Operational Space

SEM governs:

- governance scope expansion
- governance-domain inclusion
- governance-coverage growth
- governance-scope extension
- governance-scope evolution
- governance-scope auditability
- governance-scope traceability
- governance-expansion reconstruction

The module applies wherever governance scope expands into new governance domains.

Module Function

The module applies wherever systems must preserve:

- legitimate governance-scope expansions
- traceable governance growth
- reconstructable expansion history
- attributable expansion decisions
- governance-valid expansion records
- operational governance visibility

Its function is to ensure that governance can reconstruct how governance scope expanded throughout operational reality.

Minimum Implementation Framework

1. Define the Scope Expansion Object

The organization must define which governance environments require governance-scope expansion governance.
This may include:

- organizations
- institutions
- governments
- regulatory environments
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Scope Expansion Conditions

The system must define the conditions under which governance-scope expansions remain valid.
This includes:

- expansion requirements
- legitimacy requirements
- authorization requirements
- validation requirements
- traceability requirements
- governance-valid expansion conditions

3. Define Expansion Degradation Detection Logic

The system must define how governance-scope expansion failures are identified.
This may include:

- unauthorized scope expansions
- unjustified governance growth
- governance overreach
- hidden governance-domain additions
- unverifiable expansion records
- governance-invalid expansion activities

4. Define Operational Response or Governance Logic

The system must define governance logic for governance-scope expansion failures.
Governance response may include:

- expansion review
- expansion validation
- governance intervention
- corrective actions
- expansion reconstruction
- legitimacy verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

class="container"The system must preserve reconstructable traceability of:

- governance-scope expansions
- expansion decisions
- governance reviews
- intervention procedures
- validation activities
- resulting scope states

A governance environment must not remain expansion-valid if materially significant governance-scope expansions cannot be reconstructed, reviewed, justified, validated, preserved, or governed.

Use Case 1 — Enterprise Governance Growth

Scenario

An organization expands governance oversight to include newly created business units,
operational processes, and strategic activities.

Application

SEM governs governance-scope expansion, governance-domain inclusion, and governance-growth legitimacy.

Result

The organization gains controlled governance growth, reduced governance ambiguity, and stronger governance coverage.

Use Case 2 — Human-AI Governance Environment

Scenario

An organization expands governance oversight to cover newly deployed AI systems,
autonomous workflows, and AI-driven operational processes.

Application

SEM governs governance-scope expansion, AI-domain inclusion, and governance-growth validation.

Result

The organization gains stronger governance visibility, reduced governance blind spots, and improved Human-AI governance coverage.

Canonical Closing Statement

Scope Expansion Module (SEM) defines the structural conditions under which governance-scope expansions
remain legitimate, attributable, traceable, reviewable, governable, enforceable,
auditable, and operationally valid throughout the governance lifecycle.

Governance scope that expands without legitimacy becomes governance overreach. Scope Expansion therefore becomes a foundational condition of trustworthy governance scope governance.
