

ADM — Authority Delegation Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GAS-ADM-2026-06-22-0003

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Authority Governance Layer

Governed Space: Governance Authority Delegation

Category: Governance & Enforcement

Subcategory: Governance Authority Governance

Type: Governance Authority Standard Module

Parent Standard: Governance Authority Standard (GAS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Authority Standard (GAS)

· Governance Boundary Standard (GBS) · Governance Delegation Standard (GDS)

· Governance Scope Standard (GSS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Authority Delegation Module (ADM) defines the structural conditions under which governance authority delegations remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

ADM governs governance authority delegation.

The module establishes the foundational conditions required to determine how governance authority is delegated, who received delegated authority, whether delegated authority remains legitimate, and whether authority-delegation relationships remain reconstructable throughout operational reality.

Governance authority may originate from one governance actor.

Governance authority may be exercised by another.

ADM governs that delegation.

Module Operational Role

ADM defines the authority-delegation governance layer of GAS.

Its role is to establish governance-valid authority transfer relationships throughout governance environments.

Module Operational Space

ADM governs:

- governance authority delegation
- delegated authority relationships
- authority-transfer traceability
- delegated authority legitimacy
- authority delegation validation
- authority delegation governance
- authority delegation auditability
- authority delegation reconstruction

The module applies wherever governance authority may be delegated between governance actors.

Module Function

The module applies wherever systems must preserve:

- legitimate authority delegations
- traceable authority transfers
- reconstructable delegation history
- attributable delegated authority
- governance-valid delegation records
- operational delegation visibility

Its function is to ensure that governance can reconstruct how authority moved throughout governance environments.

Minimum Implementation Framework

1. Define the Authority Delegation Object

The organization must define which governance environments require authority-delegation governance.

This may include:

- organizations
- institutions
- governments
- executive structures
- governance committees
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Authority Delegation Conditions

The system must define the conditions under which governance authority delegations remain valid.
This includes:

- delegation requirements
- legitimacy requirements
- authorization requirements
- validation requirements
- traceability requirements
- governance-valid delegation conditions

3. Define Delegation Degradation Detection Logic

the system must define how authority-delegation failures are identified.
This may include:

- unauthorized delegations
- undocumented authority transfers
- illegitimate delegation activities
- hidden delegated authority
- unverifiable delegation records
- governance-invalid delegation relationships

4. Define Operational Response or Governance Logic

The system must define governance logic for authority-delegation failures.
Governance response may include:

- delegation review
- delegation validation
- governance intervention
- corrective actions
- delegation reconstruction
- authority verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- authority delegations
- delegated authority relationships
- governance reviews
- intervention procedures
- validation activities
- resulting delegation states

A governance environment must not remain delegation-valid if materially significant authority delegations cannot be reconstructed, reviewed, validated, enforced, preserved, or governed.

Use Case 1 — Executive Governance Environment

Scenario

A senior governance actor delegates governance authority to subordinate governance actors responsible for operational decision-making.

Application

ADM governs delegated authority relationships, delegation legitimacy, and authority-transfer traceability.

Result

Governance gains visibility into how authority was delegated, who received authority, and whether delegation remains governance-valid.

Use Case 2 — Human-AI Governance Environment

Scenario

Human governance actors delegate limited governance authority to AI systems operating within predefined governance boundaries.

Application

ADM governs delegated authority ownership, delegation traceability, validation requirements, and governance legitimacy.

Result

Governance gains visibility into authority delegation across Human-AI operational ecosystems.

Canonical Closing Statement

Authority Delegation Module (ADM) defines the structural conditions under which governance authority delegations remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Delegated authority remains governance-valid only when delegated authority remains traceable.

Authority Delegation

therefore becomes a foundational condition of trustworthy governance authority governance.
