

AIM — Adaptation Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-AIM-2026-06-05-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Cognitive Governance Intelligence Architecture (CLIA®)

Operational Layer: Cognitive Evolution Governance Layer

Governed Space: Adaptation Integrity

Category: AI & Interpretation

Subcategory: Adaptation Governance

Type: Cognitive Evolution Governance Module

Parent Standard: Cognitive Evolution Governance Standard (CEGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 5 June 2026

Compatibility: OOF Methodology OS ·

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Adaptation Integrity Module (AIM) defines the structural conditions under which cognition adapts to changing environments, conditions, realities, objectives, constraints, and operational contexts while remaining traceable, accountable, reality-connected, governable, and operationally valid throughout adaptation processes.

AIM governs adaptation integrity.

The module ensures that cognition remains capable of responding to change without becoming unstable, unpredictable, governance-detached, or operationally invalid.

A system satisfies AIM only if:

- adaptation remains traceable
- adaptation triggers remain identifiable
- adaptation outcomes remain assessable
- adaptation logic remains reviewable

- adaptation effects remain governable
- adaptation remains operationally valid

A cognition environment that cannot explain why adaptation occurred does not satisfy AIM.

Module Operational Role

AIM defines the adaptation-governance layer of CEGS.

Its role is to preserve integrity during cognitive adaptation.

Module Operational Space

AIM governs:

- adaptation processes
- environmental adaptation
- cognitive adjustment
- behavioral adaptation
- adaptation traceability
- adaptation accountability
- adaptive cognition
- operational adaptation

The module applies wherever cognition modifies itself in response to changing conditions.

Module Function

The module applies wherever systems must preserve:

- accountable adaptation
- reality-connected adjustment
- governance-valid cognitive change
- traceable adaptation pathways
- reconstructable adaptation logic
- operationally reliable evolution

Its function is to ensure that adaptation remains explainable and governable.

Minimum Implementation Framework

1. Define the Adaptation Object

The organization must define which adaptation activities require governance.

This may include:

- AI adaptation
 - human adaptation
 - organizational adaptation
 - institutional adaptation
 - operational adaptation
 - environmental adaptation
 - Human-AI adaptation
 - autonomous adaptation
-

2. Define Adaptation Conditions

The system must define the conditions under which adaptation remains valid.

This includes:

- trigger requirements
- traceability requirements
- accountability requirements
- validation requirements
- reality-alignment requirements
- governance-valid adaptation conditions

3. Define Adaptation Degradation Detection Logic

The system must define how adaptation degradation is identified.

This may include:

- adaptation drift
- unjustified adaptation
- hidden adaptation
- adaptation instability
- governance-blind modification
- reality-detached adaptation

4. Define Operational Response or Governance Logic

The system must define governance logic for adaptation-integrity failures.

Governance response may include:

- adaptation review
- trigger validation
- governance intervention
- escalation
- adaptation restriction
- rollback activities
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- adaptation triggers
- adaptation actions
- resulting changes
- governance reviews
- intervention actions
- resulting cognition states

A cognition environment must not remain adaptation-valid if materially significant adaptation events cannot be reconstructed, reviewed, or governed.

Use Case 1 — Autonomous Operational Agent

Scenario

An autonomous agent continuously adapts its behavior in response to changing operational conditions and environmental realities.

Application

AIM governs adaptation triggers, modification traceability, and accountability throughout the adaptation process.

Result

The environment gains stronger adaptation reliability, improved governance visibility, and reduced exposure to uncontrolled behavioral change.

Use Case 2 — Organizational Transformation Program

Scenario

An organization continuously adjusts operational structures, processes, and decision frameworks in response to market changes and emerging realities.

Application

AIM governs adaptation accountability, change traceability, and governance-valid organizational evolution.

Result

The organization gains stronger resilience, improved change management, and reduced exposure to uncontrolled transformation dynamics.

Canonical Closing Statement

Adaptation Integrity Module (AIM) defines the structural conditions under which cognition adapts to changing environments, conditions, realities, objectives, constraints, and operational contexts while remaining traceable, accountable, reality-connected, governable, and operationally valid throughout adaptation processes.

Cognitive evolution cannot remain valid if adaptation becomes uncontrolled or unexplainable. Adaptation integrity therefore becomes a foundational integrity condition of governable cognitive evolution.
