

APM — Authority & Permission Module

Standard: Execution Layer — Enforcement Standard

Category: Governance & Enforcement

Subcategory: Execution & Enforcement Systems

Type: Authority & Control Module

Version: 1.0

Status: Canonical · Open

Effective Date: 15 April 2026

Canonical Definition

Authority & Permission defines the conditions under which an entity is allowed to perform an action.

An action is valid only if it is executed by a defined entity with explicit authority and permitted scope.

If authority is not defined, the action is invalid.

Purpose

APM ensures that no action can exist without:

- identified actor
- defined authority
- permitted scope

It establishes the origin of execution.

Core Principle

No authority, no action.

MIF — Minimum Implementation Framework

A system implementing APM must:

- define the acting entity (human or system)
 - define authority source
 - define permitted actions
 - define forbidden actions
 - link authority to execution
-

Core Conditions

- every action must have an identifiable actor
 - every actor must have defined authority
 - authority must define scope of action
-

- actions outside scope are invalid
-

Failure Condition

Authority is invalid if:

- actor is undefined
 - authority is unclear
 - permissions are not explicitly defined
 - actions exceed allowed scope
-

Use Case 1 — Unauthorized System Action

Scenario

A system executes an action without clearly defined authority.

Without APM

- action occurs
- no clear responsible entity
- system appears functional

With APM

- action is blocked
- missing authority is detected

Result

Only authorized actions are executed.

Use Case 2 — Employee Permission Misuse

Scenario

An employee performs actions outside their defined role.

Without APM

- action proceeds
- misuse is detected late

With APM

- system detects scope violation
- action is prevented

Result

Execution remains within defined authority boundaries.

Closing Statement

An action without authority is not a valid action.
