

ARM — Authority Revocation Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GAS-ARM-2026-06-22-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Authority Governance Layer

Governed Space: Governance Authority Revocation

Category: Governance & Enforcement

Subcategory: Governance Authority Governance

Type: Governance Authority Standard Module

Parent Standard: Governance Authority Standard (GAS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Authority Standard (GAS)

· Governance Boundary Standard (GBS) · Governance Delegation Standard (GDS)

· Governance Scope Standard (GSS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Authority Revocation Module (ARM) defines the structural conditions under which governance authority revocations remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

ARM governs governance authority revocation.

The module establishes the foundational conditions required to determine when governance authority may be removed, why governance authority was revoked, who performed the revocation, and whether governance authority revocation remains reconstructable throughout operational reality.

Governance authority may be assigned.

Governance authority may also be revoked.

ARM governs that revocation.

Module Operational Role

ARM defines the authority-revocation governance layer of GAS.

Its role is to establish governance-valid authority termination throughout governance environments.

Module Operational Space

ARM governs:

- governance authority revocation
- authority-removal governance
- authority-revocation legitimacy
- authority-revocation validation
- authority-revocation traceability
- authority-termination governance
- authority-revocation auditability
- authority-revocation reconstruction

The module applies wherever governance authority may be removed from governance actors.

Module Function

The module applies wherever systems must preserve:

- legitimate authority revocations
- traceable authority removals
- reconstructable revocation history
- attributable revocation decisions
- governance-valid revocation records
- operational revocation visibility

Its function is to ensure that governance can reconstruct how authority exited a governance environment.

Minimum Implementation Framework

1. Define the Authority Revocation Object

The organization must define which governance environments require authority-revocation governance.

This may include:

- organizations
- institutions
- governments
- governance committees
- executive structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Authority Revocation Conditions

The system must define the conditions under which governance authority revocations remain valid.
This includes:

- revocation requirements
- legitimacy requirements
- authorization requirements
- validation requirements
- traceability requirements
- governance-valid revocation conditions

3. Define Revocation Degradation Detection Logic

The system must define how authority-revocation failures are identified.
This may include:

- unauthorized revocations
- undocumented authority removals
- illegitimate revocation actions
- hidden authority termination
- unverifiable revocation records
- governance-invalid revocation activities

4. Define Operational Response or Governance Logic

The system must define governance logic for authority-revocation failures.
Governance response may include:

- revocation review
- authority verification
- governance intervention
- corrective actions
- revocation reconstruction
- legitimacy validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- authority revocations
- authority-removal records
- governance reviews
- intervention procedures
- validation activities
- resulting authority states

A governance environment must not remain revocation-valid if materially significant authority revocations cannot be reconstructed, reviewed, validated, enforced, preserved, or governed.

Use Case 1 — Corporate Governance Environment

Scenario

A governance board removes governance authority from a governance actor following governance-policy violations.

Application

ARM governs authority-removal legitimacy, revocation traceability, and governance-valid revocation procedures.

Result

Governance gains visibility into why authority was removed, who authorized the removal, and whether revocation remains governance-valid.

Use Case 2 — AI Governance Environment

Scenario

An organization withdraws previously delegated governance authority from an AI governance system following operational-risk findings.

Application

ARM governs authority termination, revocation traceability, validation requirements, and governance legitimacy.

Result

Governance gains visibility into authority revocation across Human-AI operational ecosystems.

Canonical Closing Statement

Authority Revocation Module (ARM) defines the structural conditions under which governance authority revocations remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Governance authority that can be assigned must also be capable of being revoked. Authority Revocation therefore becomes a foundational condition of trustworthy governance authority governance.
