

AVM — Accountability Verification Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GASA-AVM-2026-06-22-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Governance Flow Position: Authority → Boundary →

Scope → Delegation → Accountability → Validation → Integrity → Transparency →

Continuity → Interoperability

Operational Layer: Governance Accountability Layer

Governed Space: Accountability Verification

Category: Governance & Enforcement

Subcategory: Governance Accountability Governance

Type: Governance Accountability Standard Module

Parent Standard: Governance Accountability Standard (GAS-A)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Accountability Standard (GAS-A)

· Governance Validation Standard (GVS) · Accountability Governance Architecture (AGA™)

· Governance Integrity Standard (GIS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Accountability Verification Module (AVM) defines the structural conditions under which governance-accountability relationships remain verifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

AVM governs accountability verification.

The module establishes the foundational conditions required to determine whether accountability ownership remains legitimate, whether accountability relationships remain valid, whether accountability attribution remains correct, and whether accountability verification remains reconstructable throughout operational reality.

Accountability may be assigned.

Accountability may be preserved.

Accountability must also be verified.

AVM governs that verification.

Module Operational Role

AVM defines the accountability-verification governance layer of GAS-A.

Its role is to establish governance-valid accountability verification throughout governance environments.

Module Operational Space

AVM governs:

- accountability verification
- accountability legitimacy verification
- accountability ownership validation
- accountability attribution verification
- accountability auditability
- accountability traceability
- accountability reviewability
- accountability reconstruction

The module applies wherever accountability relationships must be verified before governance conclusions are reached.

Module Function

The module applies wherever systems must preserve:

- verifiable accountability ownership
- legitimate accountability attribution
- traceable accountability verification
- reconstructable accountability history
- governance-valid accountability records
- operational accountability confidence

Its function is to ensure that governance can verify who remains accountable for governance outcomes.

Minimum Implementation Framework

1. Define the Accountability Verification Object

The organization must define which governance environments require accountability-verification governance.

This may include:

- organizations
- institutions
- governments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Accountability Verification Conditions

The system must define the conditions under which accountability verification remains valid.

This includes:

- verification requirements
- attribution requirements
- legitimacy requirements
- traceability requirements
- validation requirements
- governance-valid verification conditions

3. Define Verification Degradation Detection Logic

The system must define how accountability-verification failures are identified.

This may include:

- unverifiable accountability ownership
- incorrect accountability attribution
- hidden accountability relationships
- accountability ambiguity
- missing verification records
- governance-invalid accountability activities

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-verification failures.

Governance response may include:

- verification review
- accountability validation
- governance intervention
- corrective actions

- accountability reconstruction
- ownership verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability verifications
- accountability ownership records
- governance reviews
- intervention procedures
- validation activities
- resulting accountability states

A governance environment must not remain verification-valid if materially significant accountability relationships cannot be reconstructed, reviewed, verified, attributed, preserved, or governed.

Use Case 1 — Governance Investigation

Scenario

An organization investigates a governance failure and must verify who remained accountable for the resulting outcome.

Application

AVM verifies accountability ownership, accountability attribution, and accountability legitimacy.

Result

The organization gains stronger accountability certainty, reduced governance ambiguity, and improved consequence attribution.

Use Case 2 — Human-AI Governance Environment

Scenario

A Human-AI governance process produces an outcome requiring verification of accountability ownership across humans, AI systems, and governance actors.

Application

AVM verifies accountability relationships, accountability attribution, and governance-valid accountability ownership.

Result

The organization gains stronger accountability confidence,
reduced attribution uncertainty, and improved
Human-AI accountability governance.

Canonical Closing Statement

Accountability Verification Module (AVM) defines the structural
conditions under which governance-accountability relationships
remain verifiable, attributable, traceable, reviewable,
governable, enforceable, auditable, and operationally
valid throughout the governance lifecycle.

Accountability that cannot be verified cannot be trusted.
Accountability Verification therefore becomes a foundational condition
of trustworthy governance accountability governance.
