

About the User Memory Integrity Standard (UMIS)

Canonical Definition System

Canonical Definition

User Memory Integrity Standard (UMIS) defines the structural conditions under which memory associated with a specific user remains accurate, continuous, contextualized, accountable, retrievable, governable, and operationally valid throughout interactions, personalization processes, learning activities, and long-term Human-AI relationships.

UMIS governs user memory.

The standard establishes the integrity conditions required for preserving user-related memory across time while maintaining trust, contextual accuracy, continuity, accountability, and governance validity.

What This Standard Is

UMIS is a parent standard of the Memory Governance Intelligence Architecture (MGIA™).

It governs:

- user preference memory
- user context memory
- user intent memory
- user history memory
- personalization continuity
- Human-AI memory continuity
- user-memory accountability

UMIS establishes the conditions under which memory about a user remains trustworthy and operationally valid.

What This Standard Is Not

UMIS is not:

- a customer database
- a CRM system
- a personalization engine
- a recommendation algorithm
- a user profiling system
- a storage technology

UMIS does not govern how user information is stored.

UMIS governs whether user memory remains valid.

Why This Standard Exists

Future AI systems increasingly rely on persistent memory about users.

This may include:

- preferences
- interaction history
- goals
- contextual information
- personalization data
- long-term relationship continuity

Without governance:

- personalization becomes unreliable
- context becomes inaccurate
- intent becomes distorted
- trust deteriorates
- Human-AI continuity collapses

UMIS exists because user memory has become a distinct governance space.

Core Insight

Trustworthy Human-AI relationships require trustworthy user memory.

Operational Architecture Space

UMIS defines the operational architecture space for:

- user memory governance
- preference memory
- contextual memory
- intent memory
- historical memory
- personalization memory
- user continuity
- Human-AI memory relationships

This space exists because long-term interaction depends on memory continuity.

UMIS governs whether that continuity remains valid.

Use Case 1 — Personal AI Assistant

Scenario

A personal AI assistant continuously interacts with a user across months or years while preserving preferences, context, goals, and interaction history.

Application

UMIS governs preference accuracy, contextual continuity, memory accountability, and long-term relationship integrity.

Result

The assistant provides more reliable personalization, stronger continuity, and improved user trust.

Use Case 2 — Enterprise Customer Intelligence Platform

Scenario

An enterprise AI platform maintains long-term memory about customer interactions, preferences, requirements, and operational history.

Application

UMIS governs continuity, accountability, contextual relevance, and validity of customer-related memory.

Result

The organization gains stronger customer continuity, improved personalization quality, and reduced exposure to memory drift.

Architectural Position

Within the OOF system, UMIS belongs under:

AI & Interpretation

Memory Governance Intelligence Architecture (MGIA™)

UMIS serves as the parent standard governing memory associated with individual users.

It extends MGIA™ into the governance of long-term Human-AI continuity, personalization, user context, user intent, and user-memory accountability.

Relationship to CLIA®

UMIS directly supports:

- Human Cognition Integrity Standard (HCIS)
 - Human-AI Cognition Integrity Standard (HAICS)
-

- Agent Memory Integrity Standard (AMIS)

CLIA® governs cognition.

MGIA™ governs memory.

UMIS governs the memory layer associated with individual users and long-term Human-AI interaction.

Closing Definition

User memory is not merely stored information about a person. User memory is the persistent representation of preferences, context, intent, history, and continuity across interactions.

User memory remains valid only when it remains accurate, contextualized, accountable, retrievable, and governable throughout the memory lifecycle.
