

About the Memory Integrity Standard (MIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Memory Governance Intelligence Architecture (MGIA™)

Governed Space: Memory Integrity

Category: AI & Interpretation

Subcategory: Memory Governance Architecture

Type: Supporting Document

Status: Canonical · Open Standard

Effective Date: 8 June 2026

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Memory Integrity Standard (MIS) defines the structural conditions under which memory remains traceable, retrievable, coherent, accountable, reality-connected, governable, and operationally valid throughout memory creation, storage, retrieval, modification, preservation, and utilization processes.

MIS governs memory integrity.

The standard establishes the foundational conditions under which memory may be considered valid, reliable, reconstructable, and governance-compatible across human, artificial, collective, organizational, institutional, and future memory environments.

What This Standard Is

MIS is the foundational parent standard of the Memory Governance Intelligence Architecture (MGIA™).

It governs:

- memory continuity
- memory traceability
- memory accountability
- memory boundaries
- memory states
- memory preservation
- memory retrieval
- memory utilization

MIS establishes the integrity conditions required before any memory system can be considered trustworthy.

What This Standard Is Not

MIS is not:

- a database
- a storage technology
- a vector database
- a memory algorithm
- a retrieval framework
- a backup system
- a software architecture

MIS does not govern how memory is implemented.

MIS governs whether memory remains valid.

Why This Standard Exists

Every cognition system depends on memory.

Humans depend on memory.

AI systems depend on memory.

Autonomous agents depend on memory.

Organizations depend on memory.

Institutions depend on memory.

Without memory:

- context disappears
- learning disappears
- accountability disappears
- continuity disappears
- identity becomes unstable
- cognition becomes fragmented

Most governance systems focus on decisions, actions, or outputs.

MIS focuses on the persistence layer beneath them.

MIS exists because cognition cannot remain valid if memory loses integrity.

Core Insight

Memory is the persistence layer of cognition. If memory loses integrity, cognition may continue operating while progressively losing validity.

Operational Architecture Space

MIS defines the operational architecture space for:

- memory governance
- memory continuity
- memory traceability
- memory accountability
- memory preservation
- memory retrieval
- memory utilization
- memory-state governance

This space exists because memory serves as the persistence mechanism through which cognition survives across time.

MIS governs whether that persistence remains valid.

MIS serves as the foundational layer of the Memory Governance Intelligence Architecture (MGIA™).

Use Case 1 — Long-Term AI Memory System

Scenario

An AI system continuously stores, updates, retrieves, and utilizes long-term memory to support reasoning, planning, and decision-making.

Application

MIS governs memory continuity, retrieval integrity, traceability, accountability, and long-term memory validity.

Result

The system gains stronger memory reliability, improved governance visibility, and reduced exposure to memory corruption, memory drift, and context loss.

Use Case 2 — Organizational Knowledge Environment

Scenario

A large organization preserves operational knowledge, lessons

learned, procedures, decisions, and historical context across many years.

Application

MIS governs memory preservation, traceability, continuity, accountability, and reconstructability across organizational memory systems.

Result

The organization gains stronger institutional continuity, improved knowledge reliability, and reduced exposure to memory fragmentation and knowledge loss.

Architectural Position

Within the OOF system, MIS belongs under:

AI & Interpretation

Memory Governance Intelligence Architecture (MGIA™)

MIS serves as the foundational parent standard governing memory integrity.

It provides the base memory-governance conditions from which all other MGIA™ standards derive.

MIS supports:

- Agent Memory Integrity Standard (AMIS)
- User Memory Integrity Standard (UMIS)
- Group Memory Integrity Standard (GMIS)
- Temporal Memory Integrity Standard (TMIS)
- Multimodal Memory Integrity Standard (MMIS)
- Collective Memory Integrity Standard (CMIS)
- Memory Evolution Integrity Standard (MEIS)
- Memory Governance Standard (MGS)
- Skill Formation Integrity Standard (SFIS)

Relationship to CLIA®

CLIA® governs cognition.

MGIA™ governs memory.

Together they form a structured governance architecture for cognition and memory across AI systems, autonomous agents, Human-AI environments, robotics, organizations, institutions, and future intelligence ecosystems.

CLIA® spans the cognition lifecycle.

MGIA™ spans the memory lifecycle.

Together they provide the foundational governance map for future intelligence systems.

Closing Definition

Memory is not merely stored information. Memory is the persistence of cognition through time. Memory remains valid only when continuity, traceability, accountability, retrieval, preservation, and utilization remain reality-connected, reconstructable, and governance-valid throughout the memory lifecycle.
