

About the Digital Value Interaction Standard (DVIS)

What This Standard Is

The **Digital Value Interaction Standard (DVIS)** defines how value is recognized within digital systems.

It establishes a clear structural distinction between:

- interaction
- perceived value
- actual value movement

DVIS introduces a simple principle:

Not everything that looks valuable is value.

This standard defines when digital activity becomes **economic reality**.

What This Standard Is Not

DVIS is not:

- a monetization system
- a platform policy
- a pricing model
- a regulatory framework

It does not decide how value should be created or distributed.

It defines only one thing:

when value actually exists.

The Core Problem

Digital systems generate massive amounts of interaction:

- views
- likes
- clicks
- engagement

These interactions are often treated as value.

They are not.

System Distortion

The current digital environment operates on a flawed assumption:

High interaction equals high value.

In reality:

- interaction creates attention
 - attention creates perception
 - perception does not create value
-

What Is Missing

There is no clear distinction between:

- attention
- engagement
- economic value

As a result:

- value is overestimated
 - systems become inflated
 - monetization becomes unclear
-

What DVIS Changes

DVIS introduces a structural separation:

- **Value Signal** → attention without value transfer
- **Value Event** → measurable value movement

This creates a clean boundary between:

- perceived importance
 - actual value
-

Why This Matters

Without this distinction:

- platforms misinterpret activity
- creators misunderstand income sources
- systems inflate artificial value

With DVIS:

- value becomes measurable
 - transactions become identifiable
 - economic reality becomes visible
-

System Impact

DVIS enables:

- clear identification of real transactions
 - separation of engagement from revenue
 - foundation for fair monetization models
 - compatibility with auditing and governance systems
-

It transforms digital environments from:

assumed value → defined value

noise → measurable structure

Core Insight

Attention is infinite. Value is not.

Use Case 1 — Social Media Platforms

Scenario.

A platform tracks user engagement and performance.

Problem

- views and likes are treated as indicators of value
- monetization is unclear
- performance metrics are inflated

Application

DVIS separates:

- engagement → Value Signal
- payouts → Value Event

Result

- clear identification of real transactions
 - reduced distortion of metrics
 - transparent monetization logic
-

Use Case 2 — Creator Economy

Scenario

A content creator builds an audience.

Problem

- high engagement does not equal income
- value sources are unclear
- expectations are misaligned

Application

DVIS distinguishes:

- followers and likes → signals
 - subscriptions and payments → value events
-

Result

- clarity of income sources
 - realistic expectations
 - improved economic understanding
-

Use Case 3 — Digital Advertising Systems

Scenario

An advertiser pays for visibility and engagement.

Problem

- impressions and clicks are treated as value
- actual outcomes are unclear

Application

DVIS separates:

- impressions → signals
- payments and conversions → value events

Result

- clearer ROI measurement
 - reduced reliance on vanity metrics
 - improved allocation of resources
-

Closing Statement

Digital systems generate endless interaction.

Only a small fraction creates real value.

DVIS establishes a single, non-negotiable rule:

Value is not what is seen.

Value is what moves.
