

ADIM — Authority Delegation Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

Parent Standard: Authority & Accountability Layer Standard (AALS)

Category: Governance & Enforcement

Subcategory: Authority Delegation & Governance Continuity

Type: Authority & Accountability Governance Module

Derived From: Authority & Accountability Layer Standard (AALS)

Version: 1.0

Status: Canonical · Open Module

Effective Date: 15 May 2026

Compatibility: OOF Methodology OS · Authority & Accountability Layer Standard (AALS) · OBIDENITY™ ·

INTEGROS® · Runtime Integrity Standard (RIS) · Orchestration Governance Layer (OGL) · Continuous Interaction Layer (CIL) · Cognitive Layer and Interpretation Architecture Standard (CLIA) · EVIP™

AI-Readable: Yes

Authority: OOF® Origin Open Foundation™

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Delegation Integrity Module (ADIM) defines the structural conditions under which authority, execution rights, governance permissions, operational control capability, intervention legitimacy, escalation rights, and decision responsibility may be delegated, inherited, transferred, synchronized, restricted, revoked, or expired without breaking accountability continuity or operational traceability.

ADIM establishes the authority-delegation governance layer of AALS.

The module recognizes that future operational systems increasingly depend on delegated authority structures across:

- humans
- AI systems
- orchestration layers
- distributed infrastructures
- runtime environments
- organizational governance systems
- autonomous execution architectures

Where authority becomes distributed across execution environments, delegation integrity must remain structurally governable.

Module Function

ADIM governs environments where authority is:

- delegated
- inherited
- synchronized
- escalated
- transferred
- restricted
- revoked
- temporarily assigned
- runtime-expanded
- operationally distributed

The module applies to:

- enterprise governance systems
- AI orchestration environments
- delegated execution infrastructures
- robotic operational systems
- governmental operational hierarchies
- runtime execution systems
- multi-agent architectures
- platform governance systems
- autonomous execution environments
- distributed operational infrastructures

Its function is not to prohibit delegation.

Its function is to preserve accountable authority continuity during delegation processes.

Minimum Implementation Framework

Step 1 — Define the Delegation Object

The organization must define what authority condition is being delegated.

Minimum requirement:

- the delegation object is explicit
- delegated authority scope is identifiable
- operational boundaries are structurally defined
- undefined authority states are excluded from valid delegation interpretation

The delegation object may include:

- execution permissions
- intervention rights
- operational control authority
- escalation capability
- runtime governance permissions
- override legitimacy
- emergency operational authority
- AI execution delegation

- orchestration permissions
- supervisory governance rights

Step 2 — Define Delegation Integrity Conditions

The system must define what conditions preserve valid authority delegation.

Minimum requirement:

- delegation integrity conditions are explicit
- authority transfer is structurally reviewable
- accountability continuity remains preservable

Delegation integrity conditions may include:

- identity-linked delegation
- explicit permission scope
- bounded authority duration
- escalation traceability
- revocation capability
- intervention continuity
- operational responsibility persistence
- delegation visibility
- authority-boundary preservation
- execution legitimacy continuity

Under ADIM:

- **Delegated authority remains governance-valid only while accountability continuity remains operationally preservable.**

Step 3 — Define Delegation Interpretation Logic

The system must define how delegated authority is interpreted according to governance continuity conditions.

Minimum requirement:

- interpretation logic is explicit
- delegation chains remain reconstructable
- invalid authority expansion remains structurally visible

Interpretation logic may examine:

- undeclared authority inheritance
- unauthorized permission expansion
- hidden delegation layers
- runtime authority escalation
- fragmented accountability pathways
- revocation impossibility
- symbolic supervision structures

- operational-control dependency
- orchestration abstraction
- invisible authority synchronization

Under ADIM:

Authority may distribute operational execution. It may not distribute accountability into operational invisibility.

Step 4 — Define Delegation Governance Logic

The system must define how delegated authority environments remain governable.

Minimum requirement:

- delegation remains reviewable
- escalation legitimacy remains detectable
- operational authority continuity remains active

Governance logic may include:

- delegation-chain auditing
- runtime authority tracing
- permission-boundary validation
- escalation governance
- revocation verification
- override legitimacy validation
- orchestration accountability review
- autonomous delegation limitation
- escalation where delegation weakens accountability continuity

If delegated authority obscures accountable operational control, the environment becomes governance-relevant.

Step 5 — Preserve Traceability and Restrict Invalid Delegation Architecture

The system must preserve traceability of authority transfer, delegation continuity, escalation structures, and operational control capability.

Minimum requirement:

- delegation pathways remain reconstructable
- authority inheritance remains reviewable
- operational accountability remains visible
- invalid delegation architecture remains identifiable

A system becomes ADIM-invalid if:

- authority expands without validated governance conditions
- delegation obscures accountable responsibility

- runtime permissions self-escalate without traceable legitimacy
- intervention authority becomes operationally unclear
- revocation capability becomes structurally impossible
- symbolic supervision replaces executable governance capability
- operational control becomes detached from accountable authority continuity

Use Case 1 — AI Runtime Permission Delegation

Scenario

A distributed AI orchestration system delegates execution permissions across multiple autonomous runtime agents operating under layered orchestration conditions.

Application

ADIM is used to examine:

- delegation traceability
- execution legitimacy
- authority inheritance
- runtime escalation visibility
- and whether accountable operational control remains reconstructable

Result

The environment becomes governable according to authority continuity conditions rather than symbolic orchestration structure alone.

Use Case 2 — Organizational Delegation Fragmentation

Scenario

An organization distributes operational authority across contractors, agencies, subsidiaries, orchestration layers, and supervisory entities while accountability becomes operationally fragmented and difficult to reconstruct.

Application

ADIM is used to examine:

- delegation-chain visibility
- operational-control capability
- escalation ownership
- accountability continuity
- and whether delegated authority remains structurally valid

Result

The system becomes reviewable according to accountable authority continuity rather than fragmented administrative structure alone.

Canonical Closing Statement

ADIM defines the structural conditions under which delegated authority, operational control, execution legitimacy, and escalation capability remain continuously connected to accountable governance continuity before distributed execution transforms authority into operational power without reconstructable responsibility.
