

Authority & Accountability Layer Standard - (AALS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOV-AALS-2026-05-15-0001

Category: Governance & Enforcement

Subcategory: Authority, Responsibility & Operational Control

Type: Foundational Parent Layer Standard

Version: 1.0

Status: Canonical · Open Standard

Effective Date: 15 May 2026

Compatibility: OOF Methodology OS · OBIDENTITY™ · INTEGROS® · Runtime Integrity Standard (RIS) · EVIP™ ·
Orchestration Governance Layer (OGL) · Cognitive Layer and Interpretation Architecture Standard (CLIA) · SIMULOS™
· Continuous Interaction Layer (CIL) · Autonomous Runtime Systems · Human-AI Governance Architectures

AI-Readable: Yes

Authority: OOF® Origin Open Foundation™

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Authority & Accountability Layer Standard (AALS) defines the foundational governance conditions under which authority, operational control, execution legitimacy, responsibility, delegation, escalation, intervention rights, and accountability may be assigned, transferred, validated, audited, preserved, synchronized, and enforced across human, AI, autonomous, organizational, robotic, and hybrid operational systems.

AALS establishes the constitutional governance layer connecting:

- identity
- authority
- execution
- accountability
- operational legitimacy
- escalation continuity
- runtime responsibility

into a traceable operational reality structure.

Under AALS:

- **No operational action may exist without traceable authority and accountable responsibility.**

A. Standard Abstract

As operational systems increasingly transition toward:

- AI-assisted execution
- autonomous orchestration
- distributed runtime environments
- machine-governed infrastructure
- multi-agent operational coordination
- robotic execution systems
- continuous interaction environments
- hybrid human–AI governance architectures
- traditional responsibility structures become fragmented, obscured, abstracted, or operationally untraceable.

Modern systems increasingly involve:

- humans
- AI agents
- orchestration systems
- delegated authorities
- autonomous runtimes
- distributed execution environments
- optimization architectures
- machine-assisted governance layers

Without a foundational authority and accountability architecture, systems may lose:

- responsibility continuity
- execution legitimacy
- escalation ownership
- intervention traceability
- governance integrity
- operational transparency
- runtime accountability continuity

AALS establishes the constitutional governance layer required to preserve authority legitimacy and accountability continuity across increasingly autonomous operational environments.

B. Core Principle

Authority without accountability becomes uncontrolled power.

Accountability without authority becomes structurally invalid responsibility.

Operational legitimacy exists only when authority and accountability remain continuously connected through traceable governance conditions.

C. Scope

AALS may apply to:

- AI governance systems
- autonomous agents
- orchestration frameworks
- robotic systems
- enterprise runtime architectures
- industrial automation systems
- governmental digital infrastructures
- autonomous weapons governance
- platform governance systems
- distributed execution environments
- multi-agent coordination systems
- continuous interaction architectures
- simulation environments
- human-AI operational systems
- realtime decision infrastructures

The standard applies regardless of:

- centralized or decentralized architecture
- public or private infrastructure
- human or AI-operated execution
- physical or digital deployment
- local or distributed runtime environment

D. Authority Principle

AALS defines authority as:

a validated operational condition granting:

- execution legitimacy
- intervention capability
- escalation rights
- operational control
- governance power
- decision authorization
- runtime permission
- override legitimacy
- within a defined operational boundary.

Authority may:

- originate
- delegate
- synchronize
- escalate
- restrict
- revoke
- expire
- transfer
- inherit
- only through traceable governance conditions.

Under AALS:

- **Undeclared authority is operationally invalid authority.**
-

E. Accountability Principle

AALS defines accountability as:

the continuous traceable responsibility for operational decisions, executions, delegations, interventions, escalations, omissions, orchestration outcomes, and runtime consequences produced within an operational environment.

Accountability persists regardless of:

- automation depth
- orchestration abstraction
- delegation complexity
- AI assistance
- distributed execution
- runtime layering
- optimization architecture
- multi-agent coordination

Under AALS:

Operational responsibility may delegate execution. It may not delegate existence.

F. Operational Control Capability Principle

Operational control requires executable decision capability, not symbolic supervisory presence.

An entity operating as an authority, supervisory structure, orchestration layer, runtime controller, or governance operator must remain capable of:

- making operational decisions
- executing governance actions
- preserving intervention legitimacy
- enforcing validated conditions
- escalating responsibility through traceable governance structures

An operational control authority that cannot independently execute governance decisions becomes structurally dependent operational control.

Under AALS:

Validation remains structurally meaningful only where institutions preserve operational willingness and capability to enforce

validated conditions.

G. Identity Dependency

AALS operates in direct dependency with:

OBIDENTITY™ — Origin-Bound Identity

Authority and accountability cannot exist without traceable operational identity continuity.

All authority states must remain:

- attributable
- auditable
- identity-linked
- continuity-preserved
- operationally reconstructable

A system that cannot preserve identity-linked authority continuity becomes structurally governance-weak under autonomous execution conditions.

H. Delegation & Transfer Logic

AALS defines the governance conditions under which authority may:

- delegate
- escalate
- synchronize
- transfer
- inherit
- expire
- revoke

Delegated authority does not automatically eliminate originating accountability unless explicitly defined through validated governance architecture.

A system may distribute execution.

It may not distribute accountability into operational invisibility.

I. Autonomous Execution Conditions

Autonomous systems may not:

- generate undeclared authority
 - self-expand operational permissions
 - conceal execution origin
 - obscure escalation chains
 - bypass validated governance structures
 - operate without accountability continuity
-

- preserve execution while removing responsibility traceability

All autonomous execution environments must preserve:

- authority traceability
- escalation auditability
- intervention legitimacy
- execution attribution
- runtime accountability continuity

J. Human–AI Governance Principle

AALS recognizes that future operational systems increasingly involve:

- human authority
- AI-assisted authority
- delegated machine execution
- autonomous orchestration
- hybrid governance architectures
- distributed runtime intervention systems

The standard therefore establishes:

- authority hierarchy logic
- override legitimacy
- escalation governance
- intervention traceability
- runtime decision continuity
- execution ownership structures
- operational accountability synchronization

Under AALS:

Autonomous execution does not eliminate governance responsibility.

K. Runtime Accountability Continuity

Operational responsibility may not disappear through:

- automation
- orchestration abstraction
- distributed runtime execution
- AI delegation
- optimization architecture
- multi-agent coordination
- fragmented execution environments
- Responsibility continuity must remain operationally preservable across all execution layers.

AALS therefore treats accountability continuity as:

- a runtime governance condition

- an execution legitimacy condition
- a constitutional operational requirement

L. System Position

AALS functions as:

- a constitutional governance layer
- an authority architecture framework
- an accountability continuity standard
- an execution legitimacy architecture
- a responsibility traceability framework
- a runtime governance layer
- a human–AI operational authority framework

Its role is not to centralize authority.

Its role is to preserve legitimate authority and accountable execution across increasingly distributed operational systems.

M. Cross-Layer Dependency

AALS may integrate with:

- **OBIDENTITY™** for identity continuity
- **Runtime Integrity Standard (RIS)** for runtime execution integrity
- **INTEGROS®** for integrity enforcement
- **Orchestration Governance Layer (OGL)** for orchestration governance

Cognitive Layer and Interpretation Architecture Standard (CLIA) for

interpretation accountability **SIMULOS™** for simulation governance

conditions **Continuous Interaction Layer (CIL)** for continuous authority environments autonomous governance ecosystems distributed operational infrastructures AALS does not replace these layers.

It defines the constitutional authority and accountability conditions under which they remain operationally governable.

N. Compatibility Statement

A system may declare:

“Authority & Accountability Layer Compatible”

only if:

- authority remains traceable
- accountability remains continuous
- execution remains attributable
- delegation remains auditable

- escalation remains governed
- intervention remains legitimate
- operational responsibility remains preservable across all runtime layers

A system that executes operational power without reconstructable authority and accountability continuity is not AALScompatible.

O. Foundational Principle

As operational environments increasingly transition toward autonomous, distributed, AI-assisted, and continuously orchestrated execution systems, authority and accountability become constitutional governance conditions required to preserve:

- legitimate execution
 - operational trust
 - intervention legitimacy
 - governance continuity
 - runtime responsibility persistence
 - traceable operational power
 - across human and machine-operated realities.
-

Canonical Closing Statement

AALS defines the constitutional governance layer required to preserve traceable authority, accountable execution, operational legitimacy, enforceable validation, and responsibility continuity across increasingly autonomous, distributed, AI-assisted, and machine-executed operational environments before governance fragmentation transforms operational power into untraceable execution without accountable control.
