

ACOIM — Accountability Continuity Origin Integrity Module

OriginID: OOF-OID-AGA-ACOIM-2026-06-18-0076Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Accountability Continuity Governance Layer

Governed Space: Accountability Continuity Origin Integrity

Category: Governance & Enforcement

Subcategory: Accountability Continuity Governance

Type: Accountability Continuity Standard Module

Parent Standard: Accountability Continuity Standard (ACS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 18 June 2026

Compatibility: OOF Methodology OS · Accountability Continuity Standard (ACS) · Accountability Governance Standard (AGS-A) · Decision Accountability Standard (DAS) · Responsibility Continuity Standard (RCS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Accountability Continuity Origin Integrity Module (ACOIM) defines

the structural conditions under which accountability-continuity relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, reviewable, accountable, and operationally valid accountability sources throughout the accountability lifecycle.

ACOIM governs accountability-continuity origin.

The module establishes the integrity conditions required to determine where accountability continuity originated, which accountability relationship is being preserved, and whether the continuity relationship remains connected to a legitimate accountability source.

Module Operational Role

ACOIM defines the continuity-origin governance layer of ACS.

Its role is to preserve visibility into the original accountability relationship from which continuity emerges.

Module Operational Space

ACOIM governs:

- accountability continuity origin
- accountability-source continuity
- continuity attribution
- accountability provenance
- preserved accountability origin
- continuity legitimacy
- accountability-preservation origin
- continuity governance

The module applies wherever governance requires reconstruction of accountability-continuity origins.

Module Function

The module applies wherever systems must preserve:

- identifiable accountability sources
- traceable accountability origins
- reconstructable accountability history
- accountable continuity relationships
- governance-valid continuity attribution
- operationally valid accountability provenance

Its function is to ensure that governance can determine which original accountability relationship remains preserved throughout operational reality.

Minimum Implementation Framework

1. Define the Continuity Origin Object

The organization must define which accountability environments require origin governance.

This may include:

- organizational structures
- executive environments
- governance frameworks
- contractor networks
- regulatory systems
- AI governance systems
- Human-AI operational environments
- accountability programs

2. Define Continuity Origin Conditions

The system must define the conditions under which continuity origin remains valid.

This includes:

- continuity-source requirements
- attribution requirements
- legitimacy requirements
- preservation requirements
- governance requirements
- continuity-origin conditions

3. Define Origin Degradation Detection Logic

The system must define how continuity-origin failures are identified.

This may include:

- unidentified accountability origins
- undocumented continuity relationships
- illegitimate accountability structures
- governance-blind accountability preservation
- continuity-source ambiguity
- unverifiable continuity origins

4. Define Operational Response or Governance Logic

The system must define governance logic for continuity-origin failures.

Governance response may include:

- continuity review
- source verification
- governance intervention
- continuity reconstruction
- corrective actions
- continuity reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability origins
- continuity relationships
- governance reviews
- validation activities

- intervention procedures
- resulting continuity states

An accountability-continuity environment must not remain origin-valid if materially significant continuity relationships cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Executive Accountability

Environment

Scenario

A decision creates long-term consequences across multiple management periods and governance structures.

Application

ACOIM reconstructs the original accountability relationship and verifies whether accountability continuity remained connected to that origin.

Result

Governance gains visibility into the source and legitimacy of accountability continuity.

Use Case 2 — Human-AI Accountability

Environment

Scenario

Accountability relationships move between human supervisors, orchestration systems, AI agents, and governance actors during operational execution.

Application

ACOIM reconstructs the original accountability relationship and verifies continuity preservation across intelligent operational environments.

Result

Governance gains visibility into accountability continuity origins across Human-AI ecosystems.

Canonical Closing Statement

Accountability Continuity Origin Integrity Module (ACOIM) defines the structural conditions under which accountability-continuity relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, reviewable, accountable, and operationally valid accountability sources throughout the accountability lifecycle.

Accountability continuity cannot be preserved if the original accountability relationship cannot be identified. Accountability Continuity Origin Integrity therefore becomes a foundational condition of trustworthy accountability continuity governance.
