

ACOIM — Accountability Chain Origin Integrity Module

OriginID: OOF-OID-AGA-ACOIM-2026-06-18-0081Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Accountability Chain Governance Layer

Governed Space: Accountability Chain Origin Integrity

Category: Governance & Enforcement

Subcategory: Accountability Chain Governance

Type: Accountability Chain Standard Module

Parent Standard: Accountability Chain Standard (ACS-C)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 18 June 2026

Compatibility: OOF Methodology OS · Accountability Chain Standard

(ACS-C) · Accountability Continuity Standard

(ACS) · Accountability Governance Standard (AGS-A) · Decision

Accountability Standard (DAS) · INTEGROS® —

Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Accountability Chain Origin Integrity Module (ACOIM) defines the

structural conditions under which accountability- chain relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, reviewable, accountable, and operationally valid accountability origins throughout the accountability-chain lifecycle.

ACOIM governs accountability-chain origin.

The module establishes the integrity conditions required to determine where an accountability chain begins, which accountability relationship serves as the chain origin, and whether the accountability-chain origin remains legitimate and governable.

Module Operational Role

ACOIM defines the chain-origin governance layer of ACS-C.

Its role is to preserve visibility into the starting point of accountability chains.

Module Operational Space

ACOIM governs:

- accountability-chain origin
- accountability-source attribution
- accountability-chain provenance
- chain-origin governance
- accountability-root relationships
- accountability-source legitimacy
- chain-origin traceability
- accountability-chain ownership origin

The module applies wherever governance requires reconstruction of accountability-chain origins.

Module Function

The module applies wherever systems must preserve:

- identifiable accountability origins
- traceable chain sources
- reconstructable accountability roots
- accountable chain relationships
- governance-valid chain attribution
- operationally valid accountability provenance

Its function is to ensure that governance can determine where an accountability chain begins and which accountability relationship serves as the chain origin.

Minimum Implementation Framework

1. Define the Chain Origin Object

The organization must define which accountability-chain environments require origin governance.

This may include:

- contractor networks
- subcontractor chains
- corporate groups
- holding structures
- regulatory environments
- AI governance systems
- Human-AI operational environments
- multi-layer governance ecosystems

2. Define Chain Origin Conditions

The system must define the conditions under which chain origin remains valid.

This includes:

- source requirements
- attribution requirements
- legitimacy requirements
- reconstruction requirements
- governance requirements
- chain-origin conditions

3. Define Origin Degradation Detection Logic

The system must define how chain-origin failures are identified.

This may include:

- unidentified accountability origins
- undocumented chain creation
- illegitimate accountability sources
- governance-blind chain formation
- chain-origin ambiguity
- unverifiable accountability roots

4. Define Operational Response or Governance Logic

The system must define governance logic for chain-origin failures.

Governance response may include:

- chain review
- source verification
- governance intervention
- chain reconstruction
- corrective actions
- chain reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability origins
- chain relationships
- governance reviews
- validation activities
- intervention procedures
- resulting chain states

An accountability-chain environment must not remain origin-valid if materially significant chain relationships cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Multi-Layer Contractor Chain

Scenario

An operational incident occurs within a contractor-subcontractor structure involving multiple organizations.

Application

ACOIM reconstructs the original accountability relationship from which the accountability chain emerged.

Result

Governance gains visibility into the origin of the accountability chain.

Use Case 2 — Human-AI Accountability Chain

Scenario

An outcome emerges through interactions between humans, AI agents, orchestration systems, and governance actors.

Application

ACOIM identifies the original accountability relationship and reconstructs the root of the accountability chain.

Result

Governance gains visibility into accountability-chain origins across intelligent operational ecosystems.

Canonical Closing Statement

Accountability Chain Origin Integrity Module (ACOIM) defines the structural conditions under which accountability- chain relationships remain attributable to identifiable, legitimate, traceable, governable, reconstructable, reviewable, accountable, and operationally valid accountability origins throughout the accountability-chain lifecycle.

An accountability chain cannot be reconstructed if its origin cannot be identified. Accountability Chain Origin Integrity therefore becomes a foundational condition of trustworthy
