

ACTIM — Accountability Chain Traceability Integrity Module

OriginID: OOF-OID-AGA-ACTIM-2026-06-18-0084Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Accountability Chain Governance Layer

Governed Space: Accountability Chain Traceability Integrity

Category: Governance & Enforcement

Subcategory: Accountability Chain Governance

Type: Accountability Chain Standard Module

Parent Standard: Accountability Chain Standard (ACS-C)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 18 June 2026

Compatibility: OOF Methodology OS · Accountability Chain Standard

(ACS-C) · Accountability Continuity Standard

(ACS) · Responsibility Traceability Standard (RTS) · Evidence

Accountability Standard (EAS) · INTEGROS® — Integrity

Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Accountability Chain Traceability Integrity Module (ACTIM) defines

the structural conditions under which accountability-chain relationships, accountability transitions, accountability transfers, accountability delegations, accountability validations, accountability records, accountability decisions, accountability outcomes, and accountability- governance activities remain traceable, reconstructable, reviewable, auditable, governable, enforceable, and operationally valid throughout the accountability-chain lifecycle.

ACTIM governs accountability-chain traceability.

The module establishes the integrity conditions required to determine how accountability traveled through the chain, which governance actors participated in accountability transitions, how accountability relationships evolved, and whether the complete accountability chain can be reconstructed.

Module Operational Role

ACTIM defines the chain-traceability governance layer of ACS-C.

Its role is to preserve visibility and reconstructability of

Module Operational Space

ACTIM governs:

- accountability-chain traceability
- accountability-chain reconstruction
- accountability auditability
- accountability-chain governance
- accountability-transition traceability
- accountability-history reconstruction
- governance-chain traceability
- multi-layer accountability visibility

The module applies wherever governance requires reconstruction of accountability-chain history.

Module Function

The module applies wherever systems must preserve:

- traceable accountability chains
- reconstructable accountability history
- auditable accountability records
- accountable governance transitions
- governance-valid chain documentation
- operational accountability transparency

Its function is to ensure that governance can reconstruct how accountability traveled across multiple governance layers.

Minimum Implementation Framework

1. Define the Chain Traceability Object

The organization must define which accountability-chain environments require traceability governance.

This may include:

- contractor networks
- subcontractor structures
- corporate groups
- holding-company ecosystems
- regulatory environments
- AI governance systems
- Human-AI operational environments
- multi-layer governance ecosystems

2. Define Chain Traceability Conditions

The system must define the conditions under which accountability-chain traceability remains valid.

This includes:

- traceability requirements
- reconstruction requirements
- auditability requirements
- accountability-history requirements
- governance requirements
- chain-traceability conditions

3. Define Traceability Degradation Detection Logic

The system must define how accountability-chain traceability failures are identified.

This may include:

- missing accountability records
- undocumented accountability transfers
- incomplete accountability history
- accountability-chain gaps
- governance-blind accountability transitions
- unreconstructable accountability pathways

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-chain traceability failures.

Governance response may include:

- chain review
- audit procedures
- governance intervention
- chain reconstruction
- corrective actions
- traceability verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability transitions
- accountability transfers

- accountability validations
- governance reviews
- intervention procedures
- resulting chain states

An accountability-chain environment must not remain traceability-valid if materially significant accountability-chain activities cannot be reconstructed, reviewed, audited, validated, enforced, preserved, or governed.

Use Case 1 — Contractor Accountability Chain

Investigation

Scenario

An operational failure occurs within a multi-layer contractor structure involving several organizations.

Application

ACTIM reconstructs accountability transfers, governance decisions, accountability transitions, and accountability-history pathways throughout the contractor chain.

Result

Governance gains visibility into the complete accountability-chain pathway.

Use Case 2 — Human-AI Accountability

Ecosystem

Scenario

An outcome emerges through interactions between human supervisors, orchestration systems, AI agents, external services, and governance authorities.

Application

ACTIM reconstructs accountability pathways, governance decisions, accountability transitions, and accountability-history evolution across the ecosystem.

Result

Governance gains visibility into accountability-chain traceability across intelligent operational environments.

Canonical Closing Statement

Accountability Chain Traceability Integrity Module (ACTIM) defines

the structural conditions under which accountability-chain relationships, accountability transitions, accountability transfers, accountability delegations, accountability validations, accountability records, accountability decisions, accountability outcomes, and accountability- governance activities remain traceable, reconstructable, reviewable, auditable, governable, enforceable, and operationally valid throughout the accountability-chain lifecycle.

An accountability chain that cannot be reconstructed cannot be trusted. Accountability Chain Traceability Integrity therefore becomes a foundational condition of trustworthy accountability-chain governance and trustworthy consequence attribution.
