

ADAIM — Authority Delegation Accountability Integrity Module

OriginID: OOF-OID-AGA-ADAIM-2026-06-14-0015

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Delegation Governance Layer

Governed Space: Authority Delegation Accountability Integrity

Category: Governance & Enforcement

Subcategory: Authority Delegation Governance

Type: Authority Delegation Standard Module

Parent Standard: Authority Delegation Standard (ADS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Delegation Standard

(ADS) · Authority Governance Standard (AGS) ·

Accountability Governance Standard (AGS-A) · Accountability Chain

Standard (ACS-C) · Evidence Accountability

Standard (EAS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Delegation Accountability Integrity Module (ADAIM) defines

the structural conditions under which delegated authority remains attributable, accountable, traceable, evidence-supported, governable, reconstructable, and operationally valid throughout the delegation lifecycle.

ADAIM governs delegation accountability.

The module establishes the integrity conditions required to determine who delegated authority, who accepted delegated authority, who exercised delegated authority, who supervised delegated authority, and who remains accountable for outcomes arising from delegated authority.

Module Operational Role

ADAIM defines the delegation-accountability governance layer of ADS.

Its role is to ensure that accountability remains attached to delegated authority throughout governance analysis.

Module Operational Space

ADAIM governs:

- delegation accountability
- delegated-authority attribution
- delegation ownership
- delegation consequence accountability
- delegated decision accountability
- delegation supervision accountability
- delegation traceability
- accountable delegation governance

The module applies wherever governance must determine accountability connected to delegated authority.

Module Function

The module applies wherever systems must preserve:

- accountable delegation structures
- attributable authority transfers
- reconstructable delegation history
- traceable delegated decisions
- evidence-supported delegation governance
- governance-valid consequence attribution

Its function is to ensure that accountability remains visible throughout the delegation chain.

Minimum Implementation Framework

1. Define the Delegation Accountability Object

The organization must define which delegated-authority environments require accountability governance.

This may include:

- management delegation structures
- supervisory delegation chains
- contractor authority environments
- regulatory delegation systems
- Human-AI governance environments
- AI orchestration systems
- autonomous operational systems
- distributed governance architectures

2. Define Delegation Accountability Conditions

The system must define the conditions under which delegation accountability remains valid.

This includes:

- attribution requirements
- accountability requirements
- traceability requirements
- evidence requirements
- governance requirements
- accountability-valid delegation conditions

3. Define Accountability Degradation Detection Logic

The system must define how delegation-accountability failures are identified.

This may include:

- anonymous delegation
- undocumented authority transfer
- accountability gaps
- hidden delegation chains
- unverifiable delegated decisions
- governance-blind delegation structures

4. Define Operational Response or Governance Logic

The system must define governance logic for delegation-accountability failures.

Governance response may include:

- accountability review
- attribution verification
- governance intervention
- escalation
- corrective actions
- delegation restrictions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- delegation decisions
- authority-transfer events
- accountability reviews
- governance interventions
- evidence records

- resulting accountability structures

A delegation-governance environment must not remain accountability-valid if materially significant delegation activities cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Multi-Layer Organizational Delegation

Scenario

An executive delegates authority to a director, the director delegates authority to a manager, and the manager delegates authority to a supervisor who executes operational decisions.

Application

ADAIM reconstructs accountability throughout the delegation chain and determines where accountability remained, transferred, or was retained.

Result

Governance gains visibility into accountability across the entire authority-delegation structure.

Use Case 2 — Human-AI Delegation Environment

Scenario

A human operator delegates authority to an orchestration platform, which distributes delegated authority to multiple AI agents and execution systems.

Application

ADAIM reconstructs accountability throughout the delegation lifecycle and identifies accountable actors across the intelligent operational environment.

Result

Governance gains visibility into who remains accountable for decisions and outcomes generated through delegated authority.

Canonical Closing Statement

Authority Delegation Accountability Integrity Module (ADAIM) defines the structural conditions under which delegated authority remains attributable, accountable, traceable, evidence-supported,

governable, reconstructable, and operationally valid throughout the delegation lifecycle.

Authority may be delegated, but accountability must remain reconstructable. Authority delegation accountability integrity therefore becomes a foundational condition of trustworthy delegation governance.
