

# ADSIM — Authority Delegation Scope Integrity Module

**OriginID:** OOF-OID-AGA-ADSIM-2026-06-14-0012

**Architecture Ecosystem:** Structured Reality Standards™

**Architecture Family:** Accountability Governance Architecture (AGA™)

**Operational Layer:** Authority Delegation Governance Layer

**Governed Space:** Authority Delegation Scope Integrity

**Category:** Governance & Enforcement

**Subcategory:** Authority Delegation Governance

**Type:** Authority Delegation Standard Module

**Parent Standard:** Authority Delegation Standard (ADS)

**Version:** 1.0

**Status:** Canonical · Open Module

**Origin Date:** 14 June 2026

**Compatibility:** OOF Methodology OS · Authority Delegation Standard (ADS) · Authority Governance Standard (AGS) ·

Authority Validation Standard (AVS) · Authority Escalation Standard

(AES) · INTEGROS® — Integrity Standard

**AI-Readable:** Yes

**Authority:** OOF

**Protection:** MIP — Methodological Intellectual Property

**Canonical Language:** English (UCL)

---

## Canonical Definition

**Authority Delegation Scope Integrity Module (ADSIM)** defines the

structural conditions under which the extent, limits, permissions, restrictions, applicability, reach, and operational boundaries of delegated authority remain identifiable, traceable, governable, accountable, and operationally valid throughout the delegation lifecycle.

ADSIM governs delegation scope.

The module establishes the integrity conditions required to determine exactly what authority was delegated, what authority was not delegated, where delegated authority applies, and where delegated authority ends.

---

## Module Operational Role

ADSIM defines the delegation-scope governance layer of ADS.

Its role is to preserve visibility of delegated-authority limits and ensure that delegated authority remains exercised only within its legitimate scope.

# Module Operational Space

ADSIM governs:

- delegated authority scope
- delegation boundaries
- delegated permissions
- delegated restrictions
- delegation reach
- delegation applicability
- delegation limitations
- scope accountability

The module applies wherever governance requires clear limits on delegated authority.

---

## Module Function

The module applies wherever systems must preserve:

- visible delegation boundaries
- accountable delegated authority
- reconstructable delegation scope
- traceable authority permissions
- governance-valid delegation limits
- operational authority clarity

Its function is to ensure that governance can determine what authority was delegated and what authority remained with the original authority holder.

---

## Minimum Implementation Framework

### 1. Define the Delegation Scope Object

The organization must define which delegated-authority environments require scope governance.

This may include:

- management delegation
- supervisory delegation
- contractor governance
- regulatory delegation
- project governance structures
- AI orchestration systems
- autonomous operational systems
- Human-AI governance environments

## 2. Define Delegation Scope Conditions

The system must define the conditions under which delegation scope remains valid.

This includes:

- permission requirements
- restriction requirements
- boundary requirements
- governance requirements
- accountability requirements
- governance-valid delegation conditions

## 3. Define Scope Degradation Detection Logic

The system must define how delegation-scope failures are identified.

This may include:

- delegated-authority overreach
- unauthorized actions
- scope violations
- undocumented authority expansion
- governance-blind delegation
- delegation-boundary ambiguity

## 4. Define Operational Response or Governance Logic

The system must define governance logic for delegation-scope failures.

Governance response may include:

- scope review
- delegation verification
- governance intervention
- escalation
- corrective actions
- authority restriction
- operational invalidation where required

## 5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- delegated permissions
- delegated restrictions
- delegation boundaries
- governance reviews
- intervention procedures

- resulting delegation structures

A delegation-governance environment must not remain scope-valid if materially significant delegation boundaries cannot be reconstructed, reviewed, validated, or governed.

---

## Use Case 1 — Organizational Delegation

### Environment

#### Scenario

A director delegates authority to a department manager to approve operational expenditures up to a defined limit.

#### Application

ADSIM defines what authority was delegated and what authority remained outside the delegation scope.

#### Result

Governance gains visibility into the exact boundaries of delegated authority.

---

## Use Case 2 — Orchestrated Agent Environment

### Scenario

An orchestration platform delegates authority to AI agents for task execution while retaining authority over governance rules and policy modification.

#### Application

ADSIM defines the operational limits of delegated agent authority.

#### Result

Governance gains visibility into the scope and boundaries of delegated authority across intelligent operational systems.

---

## Canonical Closing Statement

**Authority Delegation Scope Integrity Module (ADSIM)** defines the structural conditions under which the extent, limits, permissions, restrictions, applicability, reach, and operational boundaries of delegated authority remain identifiable, traceable, governable, accountable, and operationally valid throughout the delegation lifecycle.

---

**Delegated authority without clear limits creates governance ambiguity. Authority delegation scope integrity therefore becomes a foundational condition of trustworthy delegation governance.**
