

AEAIM — Authority Escalation Accountability Integrity Module

OriginID: OOF-OID-AGA-AEAIM-2026-06-14-0025

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Escalation Governance Layer

Governed Space: Authority Escalation Accountability Integrity

Category: Governance & Enforcement

Subcategory: Authority Escalation Governance

Type: Authority Escalation Standard Module

Parent Standard: Authority Escalation Standard (AES)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Escalation Standard (AES) · Authority Governance Standard (AGS) · Accountability Governance Standard (AGS-A) · Evidence Accountability Standard (EAS) · Accountability Chain Standard (ACS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Escalation Accountability Integrity Module (AEAIM) defines the structural conditions under which authority escalation activities remain attributable, accountable, traceable, evidence-supported, governable, reconstructable, and operationally valid throughout the escalation lifecycle.

AEAIM governs escalation accountability.

The module establishes the integrity conditions required to determine who initiated escalation, who received escalation, who accepted escalation, who acted upon escalation, who rejected escalation, and who remains accountable for escalation outcomes and consequences.

Module Operational Role

AEAIM defines the escalation-accountability governance layer of AES.

Its role is to ensure that escalation remains connected to accountable governance actors throughout the escalation lifecycle.

Module Operational Space

AEAIM governs:

- escalation accountability
- escalation ownership
- escalation acceptance accountability
- escalation decision accountability
- escalation-response accountability
- escalation consequence accountability
- escalation traceability
- accountable escalation governance

The module applies wherever governance must determine accountability connected to escalation.

Module Function

The module applies wherever systems must preserve:

- accountable escalation structures
- attributable escalation decisions
- reconstructable escalation history
- traceable escalation outcomes
- evidence-supported escalation governance
- governance-valid consequence attribution

Its function is to ensure that accountability remains visible throughout the escalation chain.

Minimum Implementation Framework

1. Define the Escalation Accountability Object

The organization must define which escalation environments require accountability governance.

This may include:

- management escalation systems
- compliance escalation environments
- incident-management systems
- contractor governance structures
- regulatory escalation frameworks
- AI governance systems
- autonomous-agent environments
- Human-AI governance systems

2. Define Escalation Accountability Conditions

The system must define the conditions under which escalation accountability remains valid.

This includes:

- attribution requirements
- accountability requirements
- traceability requirements
- evidence requirements
- governance requirements
- accountability-valid escalation conditions

3. Define Accountability Degradation Detection Logic

The system must define how escalation-accountability failures are identified.

This may include:

- anonymous escalation decisions
- undocumented escalation actions
- accountability gaps
- rejected escalations without ownership
- hidden escalation chains
- governance-blind escalation handling

4. Define Operational Response or Governance Logic

The system must define governance logic for escalation-accountability failures.

Governance response may include:

- accountability review
- attribution verification
- governance intervention
- escalation reassignment
- corrective actions
- escalation governance review
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- escalation decisions
- escalation acceptance events
- escalation responses
- governance reviews
- intervention procedures

- resulting escalation outcomes

An authority-escalation environment must not remain accountability-valid if materially significant escalation activities cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Organizational Escalation

Environment

Scenario

A critical operational issue is escalated through multiple management levels before a final decision is reached.

Application

AEAIM reconstructs who initiated escalation, who accepted escalation, who acted on escalation, and who remains accountable for the final outcome.

Result

Governance gains visibility into accountability throughout the escalation chain.

Use Case 2 — Human-AI Escalation Environment

Scenario

An autonomous agent escalates a high-risk decision to a supervisory AI system, which subsequently escalates the matter to a human authority.

Application

AEAIM reconstructs accountability across the complete escalation path and identifies accountable actors at every escalation stage.

Result

Governance gains visibility into escalation accountability across intelligent operational systems.

Canonical Closing Statement

Authority Escalation Accountability Integrity Module (AEAIM) defines

the structural conditions under which authority escalation activities remain attributable, accountable, traceable, evidence-supported, governable, reconstructable, and operationally valid throughout the escalation lifecycle.

Escalation transfers problems upward, but it must never transfer accountability into obscurity. Authority escalation accountability integrity therefore becomes a foundational condition of trustworthy escalation governance.
