

AECIM — Authority Escalation Criteria Integrity Module

OriginID: OOF-OID-AGA-AECIM-2026-06-14-0022

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Escalation Governance Layer

Governed Space: Authority Escalation Criteria Integrity

Category: Governance & Enforcement

Subcategory: Authority Escalation Governance

Type: Authority Escalation Standard Module

Parent Standard: Authority Escalation Standard (AES)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Escalation Standard

(AES) · Authority Governance Standard (AGS) ·

Authority Delegation Standard (ADS) · Authority Validation Standard

(AVS) · Capability Readiness Governance Standard

(CRGS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Escalation Criteria Integrity Module (AECIM) defines the structural conditions under which the criteria, thresholds, triggers, requirements, rules, risk conditions, governance boundaries, and operational circumstances used to initiate escalation remain identifiable, traceable, governable, accountable, consistent, and operationally valid throughout the escalation lifecycle.

AECIM governs escalation criteria.

The module establishes the integrity conditions required to determine why escalation was required and whether the escalation decision was based upon legitimate and governable conditions.

Module Operational Role

AECIM defines the escalation-criteria governance layer of AES.

Its role is to preserve visibility of the conditions that trigger authority escalation.

Module Operational Space

AECIM governs:

- escalation criteria
- escalation thresholds
- escalation requirements
- escalation triggers
- risk-based escalation
- governance-boundary escalation
- escalation rules
- criteria accountability

The module applies wherever governance requires justification for escalation decisions.

Module Function

The module applies wherever systems must preserve:

- identifiable escalation criteria
- traceable escalation requirements
- reconstructable escalation decisions
- accountable escalation thresholds
- governance-valid escalation triggers
- operationally valid escalation conditions

Its function is to ensure that governance can determine why escalation occurred and whether escalation was justified.

Minimum Implementation Framework

1. Define the Escalation Criteria Object

The organization must define which escalation environments require criteria governance.

This may include:

- management escalation systems
- compliance escalation environments
- incident-management systems
- contractor governance structures
- safety escalation frameworks
- AI governance systems
- autonomous-agent environments
- Human-AI operational systems

2. Define Escalation Criteria Conditions

The system must define the conditions under which escalation criteria remain valid.

This includes:

- threshold requirements
- trigger requirements
- risk requirements
- accountability requirements
- governance requirements
- escalation-valid criteria conditions

3. Define Criteria Degradation Detection Logic

The system must define how escalation-criteria failures are identified.

This may include:

- undefined escalation triggers
- inconsistent escalation thresholds
- undocumented escalation criteria
- governance-blind escalation conditions
- obsolete escalation rules
- unjustified escalation decisions

4. Define Operational Response or Governance Logic

The system must define governance logic for escalation-criteria failures.

Governance response may include:

- criteria review
- threshold verification
- governance intervention
- escalation-path review
- corrective actions
- criteria revision
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- escalation criteria
- escalation thresholds
- governance reviews
- validation activities
- intervention procedures

- resulting escalation states

An authority-escalation environment must not remain criteria-valid if materially significant escalation criteria cannot be reconstructed, reviewed, validated, or governed.

Use Case 1 — Safety Escalation Environment

Scenario

A supervisor encounters a safety incident exceeding predefined operational risk thresholds.

Application

AECIM governs the criteria used to determine whether escalation is required.

Result

Governance gains visibility into why escalation occurred and whether escalation criteria remained valid.

Use Case 2 — AI Governance Environment

Scenario

An AI agent encounters a decision exceeding predefined authority limits and risk thresholds.

Application

AECIM governs the criteria that trigger escalation to a supervisory authority.

Result

Governance gains visibility into the conditions that initiated escalation across intelligent operational systems.

Canonical Closing Statement

Authority Escalation Criteria Integrity Module (AECIM) defines the structural conditions under which the criteria, thresholds, triggers, requirements, rules, risk conditions, governance boundaries, and operational circumstances used to initiate escalation remain identifiable, traceable, governable, accountable, consistent, and operationally valid throughout the escalation lifecycle.

Escalation should never occur arbitrarily. Authority escalation

criteria integrity therefore becomes a foundational condition of trustworthy escalation governance.
