

AEVIM — Authority Escalation Validity Integrity Module

OriginID: OOF-OID-AGA-AEVIM-2026-06-14-0023

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Escalation Governance Layer

Governed Space: Authority Escalation Validity Integrity

Category: Governance & Enforcement

Subcategory: Authority Escalation Governance

Type: Authority Escalation Standard Module

Parent Standard: Authority Escalation Standard (AES)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Escalation Standard (AES) · Authority Governance Standard (AGS) ·

Authority Delegation Standard (ADS) · Authority Validation Standard (AVS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Escalation Validity Integrity Module (AEVIM) defines the structural conditions under which authority escalation remains legitimate, justified, recognized, accepted, governable, accountable, reconstructable, and operationally valid throughout the escalation lifecycle.

AEVIM governs escalation validity.

The module establishes the integrity conditions required to determine whether an escalation was necessary, appropriate, properly executed, accepted by the receiving authority, and operationally valid.

Module Operational Role

AEVIM defines the escalation-validity governance layer of AES.

Its role is to ensure that escalation outcomes remain legitimate and governance-valid after escalation occurs.

Module Operational Space

AEVIM governs:

- escalation validity
- escalation legitimacy
- escalation justification
- escalation acceptance
- escalation recognition
- escalation enforceability
- escalation accountability
- escalation lifecycle governance

The module applies wherever governance requires confirmation that escalation remained valid.

Module Function

The module applies wherever systems must preserve:

- legitimate escalation decisions
- recognized escalation outcomes
- reconstructable escalation history
- accountable escalation processes
- governance-valid escalation pathways
- operationally reliable escalation outcomes

Its function is to ensure that governance can determine whether escalation was correctly performed and accepted.

Minimum Implementation Framework

1. Define the Escalation Validity Object

The organization must define which escalation environments require validity governance.

This may include:

- management escalation systems
- compliance escalation structures
- safety escalation frameworks
- contractor governance systems
- regulatory escalation environments
- AI governance systems
- autonomous-agent environments
- Human-AI governance structures

2. Define Escalation Validity Conditions

The system must define the conditions under which escalation

remains valid.

This includes:

- legitimacy requirements
- acceptance requirements
- justification requirements
- accountability requirements
- governance requirements
- escalation-valid conditions

3. Define Validity Degradation Detection Logic

The system must define how escalation-validity failures are identified.

This may include:

- unjustified escalation
- invalid escalation
- rejected escalation
- escalation to incorrect authority
- governance-invalid escalation
- unrecognized escalation outcomes

4. Define Operational Response or Governance Logic

The system must define governance logic for escalation-validity failures.

Governance response may include:

- escalation review
- escalation verification
- governance intervention
- escalation correction
- reassignment
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- escalation decisions
- escalation justifications
- escalation acceptance events
- governance reviews
- intervention procedures
- resulting escalation outcomes

An authority-escalation environment must not remain validity-valid if materially significant escalation activities cannot be reconstructed, reviewed, validated, accepted, or governed.

Use Case 1 — Organizational Governance

Environment

Scenario

A manager escalates a high-risk operational issue to executive leadership for resolution.

Application

AEVIM determines whether escalation was justified, correctly executed, and accepted by the appropriate authority.

Result

Governance gains visibility into the validity of the escalation process.

Use Case 2 — Autonomous Agent Governance

Environment

Scenario

An AI agent escalates a decision beyond its authority scope to a supervisory AI system or human operator.

Application

AEVIM validates whether escalation occurred under legitimate conditions and reached the correct authority level.

Result

Governance gains visibility into the validity of escalation across intelligent operational systems.

Canonical Closing Statement

Authority Escalation Validity Integrity Module (AEVIM) defines the structural conditions under which authority escalation remains legitimate, justified, recognized, accepted, governable, accountable, reconstructable, and operationally valid throughout the escalation lifecycle.

Escalation may occur, but not every escalation is valid. Authority

escalation validity integrity therefore becomes a foundational condition of trustworthy escalation governance.
