

AAIM — Accountability Attribution Integrity Module

OriginID: OOF-OID-AGA-AAIM-2026-06-17-0055Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Accountability Governance Layer

Governed Space: Accountability Attribution Integrity

Category: Governance & Enforcement

Subcategory: Accountability Governance

Type: Accountability Governance Standard Module

Parent Standard: Accountability Governance Standard (AGS-A)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Accountability Governance

Standard (AGS-A) · Evidence Accountability Standard

(EAS) · Consequence Governance Standard (CGS) · Chain of Control

Standard (CCS) · INTEGROS® — Integrity

Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Accountability Attribution Integrity Module (AAIM) defines the

structural conditions under which accountability remains attributable to identifiable, legitimate, traceable, governable, reconstructable, enforceable, reviewable, and operationally valid accountability holders throughout the accountability lifecycle.

AAIM governs accountability attribution.

The module establishes the integrity conditions required to determine who ultimately remains answerable for outcomes, decisions, actions, omissions, governance failures, operational results, and consequence-bearing events.

Module Operational Role

AAIM defines the accountability-attribution governance layer of AGS-A.

Its role is to ensure that accountability remains connected to identifiable accountability holders.

Module Operational Space

AAIM governs:

- accountability attribution
- accountability ownership
- answerability attribution
- outcome ownership
- governance ownership
- accountability-holder identification
- accountability allocation
- consequence attribution preparation

The module applies wherever governance must determine who ultimately answers for outcomes.

Module Function

The module applies wherever systems must preserve:

- identifiable accountability holders
- attributable accountability relationships
- reconstructable answerability chains
- governance-valid accountability ownership
- enforceable accountability attribution
- operational accountability clarity

Its function is to ensure that governance can determine who remains accountable when outcomes, failures, incidents, disputes, governance reviews, or consequence-bearing events occur.

Minimum Implementation Framework

1. Define the Accountability Attribution Object

The organization must define which accountability environments require attribution governance.

This may include:

- organizational structures
- governance systems
- contractor environments
- certification systems
- regulatory systems
- AI governance systems
- Human-AI operational environments
- accountability frameworks

2. Define Accountability Attribution Conditions

The system must define the conditions under which accountability attribution remains valid.

This includes:

- attribution requirements
- ownership requirements
- answerability requirements
- accountability-holder requirements
- governance requirements
- attribution-valid accountability conditions

3. Define Attribution Degradation Detection Logic

The system must define how accountability-attribution failures are identified.

This may include:

- unidentified accountability holders
- accountability ambiguity
- accountability fragmentation
- ownership conflicts
- governance-blind attribution
- unverifiable answerability structures

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-attribution failures.

Governance response may include:

- attribution review
- accountability verification
- governance intervention
- accountability reassignment
- corrective actions
- attribution validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability holders
- attribution decisions
- governance reviews
- validation activities

- intervention procedures
- resulting accountability states

An accountability-governance environment must not remain attribution-valid if materially significant accountability relationships cannot be attributed, reconstructed, reviewed, validated, enforced, or governed.

Use Case 1 — Governance Failure Investigation

Scenario

A major operational failure occurs involving multiple organizations, managers, contractors, supervisors, and governance actors.

Application

AAIM reconstructs governance relationships and determines who ultimately remains accountable for the outcome.

Result

Governance gains visibility into final accountability ownership.

Use Case 2 — Human-AI Accountability

Environment

Scenario

An AI-enabled operational environment produces significant outcomes requiring accountability assessment.

Application

AAIM reconstructs governance structures and identifies the accountable human, organizational, or governance entities responsible for answerability.

Result

Governance gains visibility into accountability ownership across intelligent operational ecosystems.

Canonical Closing Statement

Accountability Attribution Integrity Module (AAIM) defines the structural conditions under which accountability remains attributable to identifiable, legitimate, traceable, governable, reconstructable, enforceable, reviewable, and operationally valid accountability holders throughout the accountability lifecycle.

Governance may identify authority, responsibility, control, oversight, and evidence, but accountability attribution determines who ultimately answers for outcomes. Accountability attribution integrity therefore becomes a foundational condition of trustworthy accountability governance.
