

ASIM — Accountability Scope Integrity Module

OriginID: OOF-OID-AGA-ASIM-2026-06-17-0052Architecture **Ecosystem:** Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Accountability Governance Layer

Governed Space: Accountability Scope Integrity

Category: Governance & Enforcement

Subcategory: Accountability Governance

Type: Accountability Governance Standard Module

Parent Standard: Accountability Governance Standard (AGS-A)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Accountability Governance Standard (AGS-A) · Responsibility Governance Standard (RGS) · Chain of Control Standard (CCS) · Evidence Accountability Standard (EAS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Accountability Scope Integrity Module (ASIM) defines the structural conditions under which accountability boundaries, accountability domains, answerability obligations, governed outcomes, governed decisions, governed actions, governed omissions, and accountability responsibilities remain identifiable, traceable, governable, reconstructable, enforceable, and operationally valid throughout the accountability lifecycle.

ASIM governs accountability scope.

The module establishes the integrity conditions required to determine exactly what a subject is accountable for, what remains outside accountability boundaries, where accountability begins, and where accountability ends.

Module Operational Role

ASIM defines the accountability-scope governance layer of AGS-A.

Its role is to preserve visibility of accountability boundaries and accountability coverage.

Module Operational Space

ASIM governs:

- accountability scope
- accountability boundaries
- accountability domains
- answerability obligations
- governed outcomes
- governed decisions
- governed actions
- accountability coverage

The module applies wherever governance requires clarification of accountability boundaries.

Module Function

The module applies wherever systems must preserve:

- clearly defined accountability boundaries
- visible accountability coverage
- reconstructable accountability domains
- accountable governance assignments
- governance-valid accountability limits
- operational accountability clarity

Its function is to ensure that governance can determine exactly what a subject is accountable for and what remains outside accountability.

Minimum Implementation Framework

1. Define the Accountability Scope Object

The organization must define which accountability environments require scope governance.

This may include:

- organizational structures
- governance systems
- contractor networks
- certification environments
- regulatory systems
- AI governance systems
- Human-AI operational systems
- accountability frameworks

2. Define Accountability Scope Conditions

The system must define the conditions under which accountability scope remains valid.

This includes:

- accountability-boundary requirements
- coverage requirements
- answerability requirements
- governance requirements
- attribution requirements
- scope-valid accountability conditions

3. Define Scope Degradation Detection Logic

The system must define how accountability-scope failures are identified.

This may include:

- undefined accountability boundaries
- accountability gaps
- overlapping accountability structures
- accountability ambiguity
- governance-blind accountability assignments
- unclear answerability domains

4. Define Operational Response or Governance Logic

The system must define governance logic for accountability-scope failures.

Governance response may include:

- accountability review
- boundary verification
- governance intervention
- accountability clarification
- corrective actions
- accountability reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability assignments
- accountability boundaries
- governance reviews
- validation activities

- intervention procedures
- resulting accountability states

An accountability-governance environment must not remain scope-valid if materially significant accountability boundaries cannot be reconstructed, reviewed, validated, or governed.

Use Case 1 — Contractor Accountability

Environment

Scenario

A project involves a client, contractor, subcontractors, supervisors, and operational personnel participating in a shared operational outcome.

Application

ASIM determines exactly which outcomes, decisions, actions, and governance obligations fall within each accountability boundary.

Result

Governance gains visibility into accountability coverage and accountability limitations.

Use Case 2 — Human-AI Accountability

Environment

Scenario

Multiple AI agents, orchestration systems, operators, and organizations participate in generating operational outcomes.

Application

ASIM determines exactly which outcomes and decisions fall within each accountability domain.

Result

Governance gains visibility into accountability boundaries across intelligent operational ecosystems.

Canonical Closing Statement

Accountability Scope Integrity Module (ASIM) defines the structural conditions under which accountability boundaries, accountability domains, answerability obligations, governed outcomes, governed

decisions, governed actions, governed omissions, and accountability responsibilities remain identifiable, traceable, governable, reconstructable, enforceable, and operationally valid throughout the accountability lifecycle.

Accountability cannot be enforced if accountability boundaries are unclear. Accountability scope integrity therefore becomes a foundational condition of trustworthy accountability governance.
