

ALIM — Authority Legitimacy Integrity Module

OriginID: OOF-OID-AGA-ALIM-2026-06-14-0008

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Governance Layer

Governed Space: Authority Legitimacy Integrity

Category: Governance & Enforcement

Subcategory: Authority Governance Architecture

Type: Authority Governance Standard Module

Parent Standard: Authority Governance Standard (AGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Governance Standard (AGS) · Authority Validation Standard (AVS) ·

Authority Delegation Standard (ADS) · Relationship Accountability Standard (RAS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Legitimacy Integrity Module (ALIM) defines the structural conditions under which authority remains valid, recognized, verifiable, governable, accountable, and operationally legitimate throughout its lifecycle.

ALIM governs authority legitimacy.

The module establishes the integrity conditions required to determine whether authority represents a valid governance right rather than an assumed, fabricated, expired, unauthorized, or illegitimate authority claim.

Module Operational Role

ALIM defines the authority-legitimacy governance layer of AGS.

Its role is to ensure that authority is not merely present but legitimately exists within a recognized governance structure.

Module Operational Space

ALIM governs:

- authority legitimacy
- authority validation
- authority recognition
- authority authenticity
- authority verification
- governance legitimacy
- authority accountability
- legitimacy traceability

The module applies wherever governance requires validation of authority claims.

Module Function

The module applies wherever systems must preserve:

- legitimate authority structures
- verifiable authority claims
- accountable authority recognition
- reconstructable authority validation
- governance-valid authority rights
- operationally recognized authority

Its function is to ensure that governance can determine whether authority is genuinely legitimate.

Minimum Implementation Framework

1. Define the Authority Legitimacy Object

The organization must define which authority environments require legitimacy governance.

This may include:

- management authority
- supervisory authority
- regulatory authority
- contractual authority
- delegated authority
- institutional authority
- AI governance authority
- autonomous operational authority

2. Define Authority Legitimacy Conditions

The system must define the conditions under which authority

legitimacy remains valid.

This includes:

- validation requirements
- recognition requirements
- verification requirements
- accountability requirements
- governance requirements
- legitimacy-valid authority conditions

3. Define Legitimacy Degradation Detection Logic

The system must define how legitimacy failures are identified.

This may include:

- unauthorized authority claims
- expired authority
- fabricated authority
- unverifiable authority
- governance-invalid authority
- authority impersonation

4. Define Operational Response or Governance Logic

The system must define governance logic for legitimacy-integrity failures.

Governance response may include:

- authority validation
- legitimacy review
- governance intervention
- escalation
- authority suspension
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- authority claims
- legitimacy reviews
- validation activities
- governance decisions
- intervention procedures
- resulting authority states

An authority-governance environment must not remain legitimacy-valid if materially significant authority claims cannot be validated, reconstructed, reviewed, or governed.

Use Case 1 — Organizational Decision

Environment

Scenario

An individual issues directives affecting operational activities and personnel decisions.

Application

ALIM determines whether the individual possesses legitimate authority to issue those directives.

Result

Governance gains visibility into the validity of authority claims before operational decisions are accepted.

Use Case 2 — Autonomous Agent Governance

Environment

Scenario

A supervisory AI agent issues instructions affecting multiple execution agents.

Application

ALIM validates whether the supervisory authority remains legitimately assigned and operationally recognized.

Result

Governance gains visibility into authority legitimacy across intelligent operational systems.

Canonical Closing Statement

Authority Legitimacy Integrity Module (ALIM) defines the structural conditions under which authority remains valid, recognized, verifiable, governable, accountable, and operationally legitimate throughout its lifecycle.

Authority may exist, but not all authority is legitimate. Authority legitimacy integrity therefore becomes a foundational condition of
