

AOIM — Authority Origin Integrity Module

OriginID: OOF-OID-AGA-AOIM-2026-06-14-0006

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Governance Layer

Governed Space: Authority Origin Integrity

Category: Governance & Enforcement

Subcategory: Authority Governance Architecture

Type: Authority Governance Standard Module

Parent Standard: Authority Governance Standard (AGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Governance Standard

(AGS) · Relationship Accountability Standard

(RAS) · Authority Validation Standard (AVS) · Responsibility

Governance Standard (RGS) · INTEGROS® — Integrity
Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Origin Integrity Module (AOIM) defines the structural conditions under which authority remains attributable to an identifiable, legitimate, traceable, governable, and operationally valid source throughout its lifecycle.

AOIM governs authority origin.

The module establishes the integrity conditions required to determine where authority originated before authority may be exercised, delegated, escalated, validated, or used within governance environments.

Module Operational Role

AOIM defines the authority-origin governance layer of AGS.

Its role is to establish the source from which authority originates and to preserve traceability of authority creation throughout governance analysis.

Module Operational Space

AOIM governs:

- authority origin
- authority source identification
- authority attribution
- authority creation
- authority traceability
- authority legitimacy source
- governance-source validation
- authority provenance

The module applies wherever governance requires identification of authority origin.

Module Function

The module applies wherever systems must preserve:

- identifiable authority sources
- traceable authority creation
- reconstructable authority history
- accountable authority assignment
- governance-valid authority attribution
- operationally valid authority origin

Its function is to ensure that governance can determine where authority came from.

Minimum Implementation Framework

1. Define the Authority Origin Object

The organization must define which authority environments require origin governance.

This may include:

- organizational hierarchies
- management structures
- regulatory authorities
- contractual authorities
- delegated authorities
- AI orchestration systems
- autonomous operational environments
- Human-AI governance structures

2. Define Authority Origin Conditions

The system must define the conditions under which authority

origin remains valid.

This includes:

- source-identification requirements
- attribution requirements
- traceability requirements
- accountability requirements
- validation requirements
- governance-valid origin conditions

3. Define Origin Degradation Detection Logic

The system must define how authority-origin failures are identified.

This may include:

- unidentified authority sources
- illegitimate authority creation
- undocumented authority assignment
- governance-blind authority structures
- unverifiable authority claims
- hidden authority origins

4. Define Operational Response or Governance Logic

The system must define governance logic for authority-origin failures.

Governance response may include:

- source verification
- authority review
- governance intervention
- escalation
- authority reconstruction
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- authority sources
- authority assignments
- validation activities
- governance reviews
- intervention procedures
- resulting authority structures

An authority-governance environment must not remain origin-valid if materially significant authority sources cannot be identified, reconstructed, reviewed, validated, or governed.

Use Case 1 — Organizational Authority Structure

Scenario

A manager issues operational instructions affecting employees, contractors, and external service providers.

Application

AOIM determines how the manager obtained authority and whether the authority originated from a legitimate governance source.

Result

Governance gains visibility into the origin and legitimacy of authority.

Use Case 2 — AI Orchestration Environment

Scenario

A supervisory AI agent directs multiple execution agents operating within an orchestration system.

Application

AOIM determines where supervisory authority originated and whether it remains attributable to a legitimate governance source.

Result

Governance gains visibility into the origin of authority across intelligent operational systems.

Canonical Closing Statement

Authority Origin Integrity Module (AOIM) defines the structural conditions under which authority remains attributable to an identifiable, legitimate, traceable, governable, and operationally valid source throughout its lifecycle.

Authority without identifiable origin creates governance uncertainty. Authority origin integrity therefore becomes a foundational condition of trustworthy authority governance.
