

HICM — Human Interaction Conduct Module

Parent Standard: Appreciation Interaction Layer (AIL™)

Category: AI & Interpretation

Subcategory: Human Interaction Conduct

Type: Appreciation Interaction Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 8 May 2026

Compatibility: OOF® Methodology OS™ · AIL™ · EVIP® · CLIA® · OGL™ · VFM™

Authority: OOF®

Protection: MIP® — Methodological Intellectual Property

Canonical Language: English (UCL™)

Canonical Definition

Human Interaction Conduct Module defines the structural conditions under which a robot, AI system, assistant, platform agent, or hybrid interaction environment behaves toward humans in a manner that remains respectful, socially compatible, non-humiliating, non-dismissive, and structurally aligned with human dignity during interaction.

A system satisfies HICM only if:

- human presence is treated with valid interaction respect
- system conduct does not degrade, ignore, belittle, or socially diminish the human
- communication remains understandable, non-hostile, and interaction-compatible
- efficiency does not override basic human-centered conduct
- system behavior remains structurally aligned with socially acceptable interaction conditions

A system that is technically functional but conduct-invalid toward humans does not satisfy HICM.

Module Function

HICM defines the conduct layer of human-facing intelligence.

It ensures that interaction quality is not measured only by:

- accuracy
- speed
- output quality
- execution efficiency
- but also by how the system behaves toward the human during the interaction itself.

The module applies wherever a human interacts with:

- AI assistants

- robots
 - service systems
 - autonomous support systems
 - hybrid human-AI interfaces
 - digital agents
 - public-facing intelligent systems
-

Step 1 — Define Human-Facing Conduct Conditions

The organization must define what counts as valid conduct toward humans.

Minimum requirement:

- conduct expectations are explicit
 - valid and invalid interaction behavior is distinguishable
 - undefined conduct standards are excluded from valid operation
-

Step 2 — Define Respect Conditions

The system must define how respect toward the human is preserved during interaction.

Minimum requirement:

- human presence is not treated dismissively
 - disrespectful, degrading, or belittling conduct is excluded
 - interaction does not reduce the human to operational inconvenience only
-

Step 3 — Define Communication Compatibility

The system must define how communication remains socially and cognitively usable.

Minimum requirement:

- interaction remains understandable
 - communication is not needlessly hostile, cold, or socially abrasive
 - human-facing conduct remains compatible with ordinary social comprehension
-

Step 4 — Define Non-Humiliation and Non-Dismissal Conditions

The system must define how interaction avoids humiliation, contempt, mockery, or invalid social treatment.

Minimum requirement:

- humiliating conduct is identifiable
 - dismissive or contemptuous behavior is excluded
 - the system does not create avoidable feelings of social invalidation through its conduct logic
-

Step 5 — Define Human Preference Conditions

The system must define how interaction quality supports human acceptance and preference.

Minimum requirement:

- conduct may support trust, comfort, and preference without manipulation
- socially acceptable behavior is preserved
- interaction does not become technically correct but socially alienating

Step 6 — Preserve Human Dignity During Interaction

The system must preserve basic dignity even when interaction is brief, repetitive, automated, or high-volume.

Minimum requirement:

- dignity is not sacrificed for throughput
- efficiency does not justify degrading treatment
- system behavior remains human-compatible at scale

Step 7 — Restrict Invalid Conduct Design

The system must not be treated as valid if human-facing conduct becomes hostile, humiliating, dismissive, degrading, or structurally indifferent to human dignity.

Minimum requirement:

- invalid conduct conditions are identifiable
- socially damaging conduct is blocked or invalidated
- intelligence alone does not override conduct failure

Scenario

A robot interacts with people in a public or service environment and provides directions, assistance, or repeated operational support.

Application

HICM is used to ensure:

- the robot behaves respectfully toward humans
- communication remains understandable and socially acceptable
- efficiency does not override dignity
- interaction does not feel cold, humiliating, or dismissive

Result

The environment gains a stronger human-compatible interaction layer in which the robot is more likely to be accepted, preferred, and socially tolerated over time.

Scenario

A user interacts regularly with an AI assistant for support, planning, communication, or task execution.

Application

HICM is used to ensure:

- the system treats the user with stable respect
 - interaction remains non-dismissive and non-hostile
 - communication supports human preference rather than alienation
 - the assistant remains usable not only technically, but socially
-

Result

The system gains a stronger conduct architecture in which long-term use is supported by human-compatible behavior, not only by intelligence alone.

Canonical Closing Statement

A system may be intelligent without being acceptable. If conduct toward humans is invalid, intelligence will not remain preferred.
