

AGA™ Architecture Map

Accountability Governance Architecture

Official Accountability Governance Reference Map for Organizations, Institutions, Governments, AI Systems, Autonomous Systems, Human-AI Operational Environments, and Future Intelligent Ecosystems

AGA™ serves as the official accountability governance reference map used to identify, classify, navigate, validate, reconstruct, and understand accountability spaces across organizations, institutions, governments, AI systems, autonomous systems, Human-AI operational environments, and future intelligent ecosystems.

The purpose of AGA™ is not merely to investigate accountability after failures occur.

The purpose of AGA™ is to identify, define, govern, and map the primary accountability spaces that determine how accountability exists, operates, transfers, persists, and can be reconstructed throughout operational reality.

AGA™ serves as the official accountability governance reference map for:

- Organizations
- Institutions
- Governments
- Regulatory Authorities
- AI Systems
- Autonomous Systems
- Autonomous Agents
- Multi-Agent Systems
- Human-AI Environments
- Contractor Networks
- Supply Chains
- Corporate Groups
- Critical Infrastructure
- Future Intelligent Ecosystems

Core Architectural Principle

Every accountability space answers one primary question.

No accountability space duplicates the purpose of another accountability space.

Every accountability space begins where the previous accountability space ends.

Together these accountability spaces establish the complete accountability governance lifecycle and form the official accountability governance reference map of AGA™.

Official Governance Flow

Relationship → Authority Governance → Authority Validation → Authority Delegation → Authority Escalation → Responsibility Governance → Responsibility Assignment → Responsibility Continuity → Responsibility Traceability → Capability Readiness → Chain of Control → Governance Oversight → Evidence Accountability → Accountability Governance → Decision Accountability → Accountability Continuity → Accountability Chain

Parent Standards

For every Parent Standard use the unified OOF® structure:

- **Governed Space**
- **Core Question**
- **Canonical Definition**
- **Governance Boundary**

(Core Scope removed.)

Core Governed Spaces

- Relationship Accountability
 - Authority Governance
 - Authority Validation
 - Authority Delegation
 - Authority Escalation
 - Responsibility Governance
 - Responsibility Assignment
 - Responsibility Continuity
 - Responsibility Traceability
 - Capability Readiness
 - Chain of Control
 - Governance Oversight
 - Evidence Accountability
 - Accountability Governance
 - Decision Accountability
-

- Accountability Continuity
 - Accountability Chain
-

Architectural Position

AGA™ governs the complete accountability lifecycle.

Accountability does not begin with blame.

Accountability begins with relationships, authority, responsibility, operational capability, governance, and evidence.

The architecture progresses:

Relationship → Authority → Responsibility → Capability → Control → Oversight → Evidence → Accountability → Decision Accountability → Accountability Continuity → Accountability Chain

Together these accountability spaces govern how accountability remains identifiable, attributable, reconstructable, reviewable, enforceable, traceable, and governable throughout operational reality.

What AGA™ Defines

AGA™ defines:

- where accountability begins,
- where operational relationships originate,
- where authority operates,
- where authority is validated,
- where authority is delegated,
- where responsibility exists,
- where responsibility changes,
- where responsibility can be reconstructed,
- where operational capability becomes relevant,
- where operational control is exercised,
- where governance oversight applies,
- where evidence becomes governance-relevant,
- where accountability emerges,
- where accountable decisions are made,
- where accountability remains preserved,
- where accountability chains operate,
- where accountability governance applies.

AGA™ provides the official accountability governance language used for accountability space identification across organizational, governmental, autonomous, and intelligent systems.

CAP™ Protocol

CAP™ — Chain Accountability Protocol is the operational navigation protocol of AGA™.

AGA™ defines the accountability spaces.

CAP™ navigates through those spaces during:

- accountability investigations,
- governance analysis,
- operational reconstruction,
- accountability validation,
- evidence correlation,
- accountability-chain reconstruction.

AGA™ defines the architecture.

CAP™ applies the architecture.

Compatible OOF® Architectures

- RIS™ — Runtime Integrity Standard
 - GOA™ — Governance Architecture
 - ORA™ — Operational Reality Architecture
 - CLIA® — Cognitive Governance Intelligence Architecture
 - MGIA™ — Memory Governance Intelligence Architecture
 - AIG™ — AI Governance Architecture
 - ASGA™ — Autonomous Systems Governance Architecture
-

Canonical Principle

AGA™ does not determine who is guilty.

AGA™ governs how accountability itself remains identifiable, attributable, reconstructable, enforceable, reviewable, traceable, and governable throughout operational reality.

Canonical Closing Statement

AGA™ serves as the official accountability governance reference architecture for organizations, institutions, governments, AI systems, autonomous systems, Human-AI operational environments, and future intelligent ecosystems. By defining the primary governable accountability spaces of operational reality, AGA™ provides a structured accountability governance architecture used to identify, classify, navigate, validate, reconstruct, govern, and continuously improve accountability throughout its complete lifecycle.
