

Operational Authority Restriction Module (OARM)

OriginID: OOF-OID-ASGA-AAS-OARM-2026-07-04-0004
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Operational Authority Restriction
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Authority Standard Module
Parent Standard: Autonomous Authority Standard (AAS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 4 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Operational Authority Restriction Module (OARM) defines the structural conditions under which autonomous operational authority may be limited, constrained, or partially restricted while preserving governance control, operational safety, and accountability.

OARM governs operational authority restriction.

The module establishes the governance conditions required to ensure that autonomous operational authority remains proportional to operational conditions, governance requirements, and acceptable levels of operational risk.

Authority does not always require revocation.

Sometimes authority requires restriction.

OARM governs that restriction.

Module Operational Role

OARM defines the authority restriction layer of AAS.

Its role is to govern how operational authority may be safely

limited without unnecessarily terminating autonomous operation.

Module Operational Space

OARM governs:

- operational authority restriction,
 - authority limitation,
 - conditional authority,
 - restricted operational permissions,
 - governance-controlled authority,
 - authority containment,
 - operational authority constraints,
 - proportional authority control.
-

Module Function

The module applies wherever organizations must temporarily or permanently restrict autonomous operational authority while preserving governance integrity and operational control.

Minimum Implementation Framework

1. Define the Authority Restriction Object

Identify which operational authorities may be restricted under governed conditions.

2. Define Restriction Conditions

Establish governance conditions requiring operational authority restriction.

3. Define Restriction Failure Logic

Identify conditions where restricted authority becomes excessive, insufficient, ineffective, or governance-invalid.

4. Define Governance Response

Define governance actions for authority restriction, adjustment, monitoring, escalation, or restoration.

5. Preserve Restriction Traceability

Preserve restriction decisions, governance approvals, operational evidence, authority changes, and supporting documentation.

Use Case 1 — Autonomous Industrial Robot

Scenario

An autonomous production robot detects an abnormal operating condition during manufacturing.

Application

OARM restricts the robot's operational authority to predefined safe functions until the condition is resolved.

Result

Operations continue under controlled authority while governance and operational safety remain preserved.

Use Case 2 — Autonomous Financial Trading Agent

Scenario

An autonomous trading system exceeds predefined operational risk thresholds.

Application OARM limits the agent's operational authority by restricting high-risk trading activities while allowing approved monitoring functions.

Result

The organization reduces operational risk without requiring a complete operational shutdown.

Canonical Closing Statement

Governable authority includes the ability to limit authority when conditions require it. Operational Authority Restriction preserves safe, controlled, and accountable autonomy by ensuring that operational permissions remain proportionate to governance requirements.
