

Autonomous Coordination Module (ACM)

OriginID: OOF-OID-ASGA-ACOS-ACM-2026-07-08-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Autonomous Operational Coordination
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Coordination Standard Module
Parent Standard: Autonomous Coordination Standard (ACOS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 8 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Autonomous Coordination Module (ACM) defines the structural conditions under which autonomous operational actors establish, maintain, and govern coordinated operational relationships throughout autonomous operation.

ACM governs autonomous operational coordination.

The module establishes the governance conditions required to ensure that autonomous systems coordinate their activities through structured, governance-approved operational relationships.

Independent operation enables autonomy.

Coordinated operation enables autonomous ecosystems.

ACM governs that coordination.

Module Operational Role

ACM defines the core coordination layer of ACOS.

Its role is to establish governed coordination between autonomous operational actors before and during autonomous execution.

Module Operational Space

ACM governs:

- autonomous operational coordination,
 - coordinated autonomous operation,
 - operational collaboration,
 - coordinated operational relationships,
 - autonomous interaction governance,
 - governed operational cooperation,
 - autonomous coordination structures,
 - collaborative autonomous execution.
-

Module Function

The module applies wherever two or more autonomous operational actors must coordinate activities while preserving governance integrity, operational consistency, and trustworthy collaboration.

Minimum Implementation Framework

1. Define the Coordination Object

Identify which autonomous operational actors require coordinated operation.

2. Define Coordination Conditions

Establish governance conditions governing coordinated autonomous interaction and shared operational activities.

3. Define Coordination Failure Logic

Identify conditions where coordination becomes inconsistent, interrupted, conflicting, or governance-invalid.

4. Define Governance Response

Define governance actions for coordination adjustment, synchronization, operational intervention, escalation, or recovery.

5. Preserve Coordination Traceability

Preserve coordination records, governance decisions, operational evidence, interaction history, and supporting documentation.

Use Case 1 — Autonomous Warehouse Fleet

Scenario

Multiple autonomous warehouse robots cooperate to transport

materials across a logistics facility.

Application

ACM governs how robots coordinate movement, task allocation, and operational cooperation.

Result

Warehouse operations remain synchronized, efficient, and continuously governed.

Use Case 2 — Multi-Agent AI Operations Platform

Scenario

Multiple autonomous AI agents collaborate to execute enterprise operational workflows.

Application

ACM governs coordination between agents to ensure consistent execution of shared operational objectives.

Result

The organization maintains reliable, governed, and trustworthy autonomous collaboration.

Canonical Closing Statement

Autonomous ecosystems require governed coordination. Autonomous Coordination establishes the governance foundation that enables autonomous operational actors to collaborate safely, consistently, and under continuous governance.
