

Operational Conflict Resolution Module (OCRM)

OriginID: OOF-OID-ASGA-ACOS-OCRM-2026-07-08-0004
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Operational Conflict Resolution
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Coordination Standard Module
Parent Standard: Autonomous Coordination Standard (ACOS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 8 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Operational Conflict Resolution Module (OCRM) defines the structural conditions under which operational conflicts between autonomous operational actors are identified, evaluated, resolved, and governed while preserving operational consistency, governance integrity, and coordinated autonomous operation.

OCRM governs operational conflict resolution.

The module establishes the governance conditions required to ensure that conflicts between autonomous operational actors are resolved in a controlled, traceable, and governance-approved manner.

Coordination may create conflicts.

Governance must resolve them.

OCRM governs that resolution.

Module Operational Role

OCRM defines the operational conflict resolution layer of ACOS.

Its role is to preserve coordinated autonomous operation by governing how operational conflicts are detected and resolved.

Module Operational Space

OCRM governs:

- operational conflict resolution,
- autonomous operational conflicts,
- coordination conflict management,
- conflict evaluation,
- governed conflict resolution,
- operational decision conflicts,
- collaborative conflict handling,
- operational consistency restoration.

Module Function

The module applies wherever autonomous operational actors may generate conflicting actions, priorities, objectives, or operational decisions requiring governance intervention.

Minimum Implementation Framework

1. Define the Conflict Object

Identify which operational conflicts require governed resolution.

2. Define Conflict Resolution Conditions Establish governance conditions governing conflict identification, evaluation, prioritization, and resolution.

3. Define Conflict Failure Logic

Identify conditions where conflicts remain unresolved, escalate unnecessarily, recur, or become governance-invalid.

4. Define Governance Response

Define governance actions for conflict resolution, operational reprioritization, coordination adjustment, escalation, or human intervention.

5. Preserve Conflict Traceability

Preserve conflict records, governance decisions, operational evidence, resolution history, and supporting documentation.

Use Case 1 — Autonomous Warehouse Fleet

Scenario

Two autonomous transport robots simultaneously attempt to access the same loading zone.

Application

OCRM governs conflict resolution by assigning operational priority and coordinating safe task execution.

Result

The conflict is resolved without disrupting warehouse operations or governance integrity.

Use Case 2 — Multi-Agent AI Operations Platform

Scenario

Multiple autonomous AI agents generate conflicting operational recommendations for the same business process.

Application

OCRM evaluates the conflict and applies governance-approved resolution rules before execution continues.

Result

Enterprise operations remain coordinated, consistent, and operationally trustworthy.

Canonical Closing Statement

Governable coordination requires governable conflict resolution.

Operational Conflict Resolution ensures that conflicts between autonomous operational actors are resolved consistently, transparently, and under continuous governance, preserving reliable autonomous collaboration.
