

About Autonomous Compatibility Standard (ACPS)

Governing Autonomous Operational Compatibility

Autonomous Compatibility Standard (ACPS) defines the governance conditions under which autonomous operational compatibility remains interoperable, aligned, trustworthy, and governable throughout the complete autonomous operational lifecycle.

Autonomous systems increasingly operate as part of larger operational ecosystems.

Operational compatibility enables independently developed autonomous systems to work together under shared governance conditions.

ACPS governs this operational governance space.

What Is Autonomous Operational Compatibility?

Autonomous operational compatibility is the governed ability of autonomous operational actors to operate together across different platforms, technologies, organizations, and operational environments while preserving governance integrity and operational consistency.

It enables organizations to establish interoperable autonomous operations, maintain governance alignment, preserve operational trust, validate compatibility, and support scalable autonomous ecosystems.

Canonical Definition

Autonomous Compatibility Standard (ACPS) defines the structural conditions under which autonomous operational systems remain compatible, interoperable, governable, and operationally aligned while interacting across heterogeneous autonomous operational environments throughout the complete autonomous operational lifecycle.

Why ACPS Exists

Future autonomous ecosystems will consist of autonomous systems developed by different organizations using different technologies and operational models.

Without governed compatibility, autonomous operations become fragmented, difficult to coordinate, and increasingly unreliable.

ACPS exists because autonomous operational compatibility represents the **ninth governable space** of **Autonomous Systems Governance Architecture (ASGA™)**.

What ACPS Governs

ACPS governs the structural conditions under which autonomous operational compatibility remains:

- interoperable,
- aligned,
- trustworthy,
- validated,
- resilient,
- governable.

Rather than governing communication technologies or technical integration protocols, ACPS governs the governance conditions required for trustworthy autonomous operational compatibility.

Architectural Position

Autonomous Compatibility Standard serves as the **ninth governance space** of **Autonomous Systems Governance Architecture (ASGA™)**.

It establishes the governance foundation that enables autonomous operational actors to cooperate reliably across diverse autonomous ecosystems.

Without governed compatibility, scalable autonomous ecosystems cannot operate consistently.

Canonical Closing Statement

Governable autonomy requires governable compatibility. Autonomous Compatibility establishes the governance foundation that enables autonomous operational ecosystems to remain interoperable, coordinated, trustworthy, and continuously governable throughout the complete autonomous operational lifecycle.
