

# Execution Authorization Module (EAM)

**OriginID:** OOF-OID-ASGA-AES-EAM-2026-07-04-0001  
**Architecture Ecosystem:** Structured Reality Standards™  
**Architecture Family:** Autonomous Systems Governance Architecture (ASGA™)  
**Operational Layer:** Autonomous Operational Governance Layer  
**Governed Space:** Execution Authorization  
**Category:** Governance & Enforcement  
**Subcategory:** Autonomous Operational Governance  
**Type:** Autonomous Execution Standard Module  
**Parent Standard:** Autonomous Execution Standard (AES)  
**Version:** 1.0  
**Status:** Canonical · Open Module  
**Origin Date:** 4 July 2026  
**Compatibility:** OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™  
**AI-Readable:** Yes  
**Authority:** OOF®  
**Protection:** MIP™ — Methodological Intellectual Property  
**Canonical Language:** English (UCL)

---

## Canonical Definition

**Execution Authorization Module (EAM)** defines the structural conditions under which autonomous operations are authorized before execution begins while preserving governance legitimacy, operational control, and accountable autonomous operation.

EAM governs execution authorization.

The module establishes the governance conditions required to ensure that every autonomous operation is explicitly authorized before execution is initiated.

Authority grants permission.

Execution authorization grants permission to begin.

EAM governs that authorization.

---

## Module Operational Role

EAM defines the execution authorization layer of AES.

Its role is to ensure that autonomous operations begin only after legitimate operational authorization has been established.

---

# Module Operational Space

EAM governs:

- execution authorization,
- operational execution approval,
- authorized operation initiation,
- governance-approved execution,
- execution permissions,
- execution legitimacy,
- operational authorization,
- controlled execution initiation.

---

## Module Function

The module applies wherever organizations must ensure that autonomous operations are formally authorized before execution begins.

---

## Minimum Implementation Framework

### 1. Define the Execution Authorization Object

Identify which autonomous operations require execution authorization.

### 2. Define Authorization Conditions

Establish governance conditions required before autonomous execution may begin.

### 3. Define Authorization Failure Logic

Identify conditions where execution authorization becomes invalid, incomplete, unauthorized, or governance- noncompliant.

### 4. Define Governance Response

Define governance actions for execution approval, rejection, suspension, delay, or escalation.

### 5. Preserve Authorization Traceability

Preserve execution authorizations, governance approvals, operational evidence, authorization history, and supporting documentation.

---

## Use Case 1 — Autonomous Warehouse Robot

### Scenario

An autonomous warehouse robot receives a new transport assignment.

## Application

EAM verifies and authorizes the operation before execution begins.

## Result

The robot performs the task only after governance-approved execution authorization has been granted.

---

## Use Case 2 — Autonomous Medical AI Assistant

### Scenario

An autonomous clinical assistant prepares to initiate an approved diagnostic workflow.

### Application

EAM confirms execution authorization before autonomous processing begins.

### Result

The healthcare organization ensures that autonomous execution starts only under legitimate governance approval.

---

## Canonical Closing Statement

**Every autonomous operation should begin with explicit authorization. Execution Authorization ensures that autonomous execution starts only under legitimate, governed, and accountable operational conditions.**

---
