

Escalation Trigger Module (ETM)

OriginID: OOF-OID-ASGA-AESS-ETM-2026-07-08-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Escalation Triggers
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Escalation Standard Module
Parent Standard: Autonomous Escalation Standard (AESS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 8 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Escalation Trigger Module (ETM) defines the structural conditions under which autonomous operational events trigger governed escalation before autonomous operation exceeds approved governance, safety, operational, or risk limits.

ETM governs escalation triggers.

The module establishes the governance conditions required to ensure that autonomous systems recognize predefined escalation conditions and initiate appropriate governance responses without unnecessary delay.

Escalation begins with recognition.

Governed recognition begins with defined triggers.

ETM governs those triggers.

Module Operational Role

ETM defines the escalation trigger layer of AESS.

Its role is to identify when autonomous operation must initiate governed escalation.

Module Operational Space

ETM governs:

- escalation triggers,
- escalation conditions,
- trigger identification,
- operational escalation events,
- governance trigger logic,
- risk-triggered escalation,
- autonomous escalation initiation,
- governed escalation activation.

Module Function

The module applies wherever organizations must define objective conditions that automatically initiate escalation during autonomous operation.

Minimum Implementation Framework

1. Define the Escalation Trigger Object

Identify which operational events require automatic escalation.

2. Define Trigger Conditions

Establish governance conditions governing when escalation must begin.

3. Define Trigger Failure Logic

Identify conditions where escalation triggers are missing, delayed, ignored, or governance-invalid.

4. Define Governance Response

Define governance actions for escalation initiation, operational restriction, human notification, intervention, or emergency procedures.

5. Preserve Trigger Traceability

Preserve trigger definitions, governance decisions, operational evidence, escalation history, and supporting documentation.

Use Case 1 — Autonomous Industrial Robot

Scenario

An autonomous robot detects abnormal force levels during a

manufacturing operation.

Application

ETM identifies the predefined escalation trigger and immediately initiates governance-approved escalation.

Result

The operation transitions to controlled intervention before equipment damage or safety risks increase.

Use Case 2 — Autonomous Financial AI Platform

Scenario An autonomous trading agent detects abnormal market volatility beyond approved operational thresholds.

Application

ETM activates escalation based on predefined governance trigger conditions.

Result

The organization responds before unacceptable operational or financial risk develops.

Canonical Closing Statement

Governable escalation begins with governable triggers. Escalation Trigger ensures that autonomous systems recognize when independent operation must give way to governed intervention, preserving safety, accountability, and operational trust.
