

Evolution Authorization Module (EAM)

OriginID: OOF-OID-ASGA-AEVS-EAM-2026-07-08-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Evolution Authorization
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Evolution Standard Module
Parent Standard: Autonomous Evolution Standard (AEVS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 8 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Evolution Authorization Module (EAM) defines the structural conditions under which autonomous operational evolution is requested, evaluated, authorized, and governed before changes to autonomous capabilities are permitted.

EAM governs evolution authorization.

The module establishes the governance conditions required to ensure that autonomous systems evolve only through approved, justified, and governance-authorized changes.

Evolution should not occur automatically.

Evolution should occur through governed authorization.

EAM governs that authorization.

Module Operational Role

EAM defines the evolution authorization layer of AEVS.

Its role is to ensure that every significant autonomous evolution is approved before implementation.

Module Operational Space

EAM governs:

- evolution authorization,
 - change approval,
 - governed evolution,
 - operational change authorization,
 - capability evolution approval,
 - governance authorization,
 - controlled autonomous evolution,
 - authorized operational adaptation.
-

Module Function

The module applies wherever organizations must authorize autonomous evolution before operational capabilities are modified.

Minimum Implementation Framework

1. Define the Evolution Authorization Object

Identify which autonomous capability changes require formal authorization.

2. Define Authorization Conditions

Establish governance conditions governing evolution approval and operational change authorization.

3. Define Authorization Failure Logic

Identify conditions where evolution becomes unauthorized, unjustified, uncontrolled, or governance-invalid.

4. Define Governance Response

Define governance actions for approval, rejection, revision, escalation, or suspension of proposed autonomous evolution.

5. Preserve Authorization Traceability

Preserve authorization requests, governance decisions, operational evidence, approval history, and supporting documentation.

Use Case 1 — Autonomous Warehouse Robotics

Scenario

A fleet of warehouse robots receives a proposal to optimize autonomous navigation behavior.

Application

EAM requires governance authorization before operational changes are deployed.

Result

Navigation improvements are introduced through controlled and accountable governance.

Use Case 2 — Enterprise Autonomous AI Platform

Scenario

An autonomous AI platform proposes new workflow optimization capabilities.

Application

EAM evaluates and authorizes the proposed operational evolution before implementation.

Result

The organization ensures that autonomous improvements remain governed, justified, and operationally trustworthy.

Canonical Closing Statement

Governable evolution begins with governable authorization. Evolution Authorization ensures that autonomous operational systems evolve only through approved, justified, and continuously governed change.
