

About Autonomous Identity Standard (AIS)

Governing Autonomous Operational Identity

Autonomous Identity Standard (AIS) defines the governance conditions under which an autonomous operational actor remains uniquely identifiable, attributable, verifiable, continuous, and governable throughout the complete autonomous operational lifecycle.

Autonomous operation begins with identity.

Before an autonomous system can receive authority, execute actions, coordinate with other systems, or assume operational responsibilities, its operational identity must first be established.

AIS governs this foundational governance space.

What Is Autonomous Operational Identity?

Autonomous operational identity is the governable identity of an autonomous operational actor.

It enables organizations to determine **who or what** is performing an autonomous operation, attribute actions to the correct operational actor, preserve identity throughout the operational lifecycle, and establish the governance foundation required for authority, accountability, trust, and coordination.

Canonical Definition

Autonomous Identity Standard (AIS) defines the structural conditions under which an autonomous operational actor remains uniquely identifiable, attributable, verifiable, continuous, and governable throughout the complete autonomous operational lifecycle.

Why AIS Exists

Every autonomous operation is performed by an operational actor.

If that actor cannot be reliably identified, governance cannot reliably assign authority, preserve accountability, establish trust, or coordinate autonomous operations.

AIS exists because autonomous operational identity is the first governable space of Autonomous Systems Governance Architecture (ASGA™).

What AIS Governs

AIS governs the structural conditions under which autonomous operational identity remains:

- unique,
- attributable,
- verifiable,
- continuous,
- trustworthy,
- governable.

Rather than governing technical identity mechanisms, AIS governs the governance conditions required for trustworthy autonomous operational identity.

Architectural Position

Autonomous Identity Standard serves as the **first governance space** of **Autonomous Systems Governance Architecture (ASGA™)**.

It establishes the identity foundation upon which every subsequent autonomous governance space depends.

Without identity, autonomous governance cannot begin.

Canonical Closing Statement

Every autonomous operation begins with an identifiable operational actor. Autonomous Identity establishes the first governance foundation upon which trustworthy autonomous operation is built.
