

Autonomous Identity Lifecycle Module (AILM)

OriginID: OOF-OID-ASGA-AIS-AILM-2026-07-04-0004
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Autonomous Identity Lifecycle
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Identity Standard Module
Parent Standard: Autonomous Identity Standard (AIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 4 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Autonomous Identity Lifecycle Module (AILM) defines the structural conditions under which autonomous operational identity is created, maintained, modified, suspended, transferred, retired, and archived while preserving governance integrity throughout the complete autonomous operational lifecycle.

AILM governs the autonomous identity lifecycle.

The module establishes the governance conditions required to ensure that autonomous operational identity remains governed from its creation to its retirement.

Identity has a beginning.

Identity has an operational life.

Identity has an end.

AILM governs that lifecycle.

Module Operational Role

AILM defines the identity lifecycle layer of AIS.

Its role is to govern every lifecycle stage of autonomous

Module Operational Space

AILM governs:

- autonomous identity creation,
 - identity activation,
 - identity modification,
 - identity suspension,
 - identity transfer,
 - identity retirement,
 - identity archival,
 - lifecycle governance.
-

Module Function

The module applies wherever organizations must govern autonomous operational identity across its complete lifecycle while preserving governance integrity, operational continuity, and accountability.

Minimum Implementation Framework

1. Define the Identity Lifecycle Object

Identify which autonomous operational identities require lifecycle governance.

2. Define Lifecycle Conditions Establish governance conditions for identity creation, activation, modification, suspension, transfer, retirement, and archival.

3. Define Lifecycle Failure Logic

Identify conditions where lifecycle governance becomes incomplete, inconsistent, unauthorized, or no longer governable.

4. Define Governance Response

Define governance actions for lifecycle approval, suspension, retirement, restoration, or administrative review.

5. Preserve Lifecycle Traceability

Preserve lifecycle events, governance approvals, operational records, and supporting evidence throughout the complete identity lifecycle.

Use Case 1 — Autonomous Inspection Drone

Scenario

A fleet of autonomous inspection drones is deployed, upgraded, and eventually retired after years of operation.

Application

AILM governs the complete lifecycle of each drone's operational identity from initial activation through retirement.

Result

The organization preserves continuous governance, operational history, and lifecycle accountability.

Use Case 2 — Enterprise AI Agent Platform

Scenario

An enterprise continuously creates, updates, suspends, and retires autonomous AI agents performing operational tasks.

Application

AILM governs every lifecycle transition while preserving identity continuity and governance integrity.

Result

The organization maintains controlled autonomous identity management throughout the entire operational lifecycle.

Canonical Closing Statement

Governable autonomy requires governable identity from beginning to end. Autonomous Identity Lifecycle ensures that every operational identity remains governed throughout its complete existence, preserving trust, accountability, and operational continuity.
