

Autonomous Identity Verification Module (AIVM)

OriginID: OOF-OID-ASGA-AIS-AIVM-2026-06-26-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Autonomous Identity Verification
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Identity Standard Module
Parent Standard: Autonomous Identity Standard (AIS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 26 June 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Autonomous Identity Verification Module (AIVM) defines the structural conditions under which the identity of an autonomous operational actor can be verified before autonomous operations are authorized, executed, or coordinated.

AIVM governs autonomous identity verification.

The module establishes the governance conditions required to ensure that every autonomous operational actor can be independently verified before participating in autonomous operations.

Identity claimed is not identity verified.

AIVM governs that verification.

Module Operational Role

AIVM defines the identity verification layer of AIS.

Its role is to verify the authenticity of every autonomous operational actor before autonomous operation begins.

Module Operational Space

AIVM governs:

- autonomous identity verification,
- identity authenticity,
- operational identity validation,
- identity confirmation,
- trusted operational identity,
- verification governance,
- operational identity assurance,
- identity trust.

Module Function

The module applies wherever organizations must ensure that autonomous operational identities are authentic, verifiable, trustworthy, and governance-valid before operational authority is granted.

Minimum Implementation Framework

1. Define the Identity Verification Object

Identify which autonomous operational identities require verification.

2. Define Verification Conditions

Establish the governance conditions required to verify operational identity.

3. Define Verification Failure Logic

Identify conditions under which identity verification fails or cannot be completed.

4. Define Governance Response

Define the governance actions when verification succeeds, fails, or requires escalation.

5. Preserve Verification Traceability

Preserve evidence, verification results, governance decisions, and operational records supporting identity verification.

Use Case 1 — Autonomous Delivery Robot

Scenario

A delivery robot requests authorization to begin autonomous operations.

Application

AIVM verifies the robot's operational identity before authority is granted.

Result

Only verified autonomous operational actors may begin governed operations.

Use Case 2 — Multi-Agent AI Environment

Scenario

Multiple autonomous AI agents cooperate to complete a complex operational objective.

Application

AIVM verifies the operational identity of each participating autonomous agent before coordination begins.

Result

The organization establishes trusted autonomous collaboration based on verified operational identities.

Canonical Closing Statement

Trustworthy autonomy begins with trusted identity. Autonomous Identity Verification ensures that every autonomous operation starts with an operational actor whose identity can be confidently verified before independent action begins.
