

Operational Risk Classification Module (ORCM)

OriginID: OOF-OID-ASGA-ARTS-ORCM-2026-07-06-0001
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Autonomous Systems Governance Architecture (ASGA™)
Operational Layer: Autonomous Operational Governance Layer
Governed Space: Operational Risk Classification
Category: Governance & Enforcement
Subcategory: Autonomous Operational Governance
Type: Autonomous Risk & Trust Standard Module
Parent Standard: Autonomous Risk & Trust Standard (ARTS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 6 July 2026
Compatibility: OOF Methodology OS · GOA™ · ORA™ · AGA™ · AIG® · CLIA® · MGIA™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Operational Risk Classification Module (ORCM) defines the structural conditions under which autonomous operational risks are identified, classified, prioritized, and governed before and during autonomous operation.

ORCM governs operational risk classification.

The module establishes the governance conditions required to ensure that autonomous operational risks are consistently evaluated according to their potential impact, likelihood, and operational significance.

Risk cannot be governed until it is classified.

ORCM governs that classification.

Module Operational Role

ORCM defines the operational risk classification layer of ARTS.

Its role is to establish a consistent governance framework for identifying and classifying operational risks throughout autonomous operation.

Module Operational Space

ORCM governs:

- operational risk classification,
- risk identification,
- risk categorization,
- operational risk prioritization,
- governance risk assessment,
- risk severity classification,
- operational risk governance,
- continuous risk evaluation.

Module Function

The module applies wherever organizations must identify and classify autonomous operational risks before and throughout autonomous execution.

Minimum Implementation Framework

1. Define the Risk Classification Object

Identify which autonomous operational activities require risk classification.

2. Define Classification Conditions

Establish governance conditions for identifying, categorizing, and prioritizing operational risks.

3. Define Classification Failure Logic

Identify conditions where risk classification becomes incomplete, inaccurate, inconsistent, or governance-invalid.

4. Define Governance Response

Define governance actions for risk acceptance, mitigation, escalation, reassessment, or operational restriction.

5. Preserve Risk Traceability

Preserve risk classifications, governance decisions, operational evidence, reassessment history, and supporting documentation.

Use Case 1 — Autonomous Cargo Drone

Scenario

An autonomous cargo drone prepares to operate under changing weather

conditions.

Application

ORCM classifies operational risks before mission execution and adjusts governance requirements accordingly.

Result

The mission proceeds with risk awareness, appropriate operational controls, and governance oversight.

Use Case 2 — Autonomous Healthcare Robot

Scenario

An autonomous clinical robot performs patient-support activities within a hospital.

Application

ORCM continuously classifies operational risks associated with patient interaction and clinical procedures.

Result

Healthcare operations remain aligned with governance requirements and acceptable operational risk levels.

Canonical Closing Statement

Governable autonomy begins with governable risk understanding. Operational Risk Classification ensures that autonomous operational risks are consistently identified, prioritized, and governed before they become operational failures.
