

ASGA™ Complete Standards & Modules Index

Autonomous Systems Governance Architecture

Official Autonomous Operational Governance Map for Autonomous Systems, AI Agents, Robotics, Autonomous Vehicles, Industrial Automation, Critical Infrastructure, Human-AI Environments, and Future Autonomous Ecosystems

This document serves as the official OOF® autonomous operational governance map and structural index used for autonomous operational governance identification, autonomous governance classification, autonomous operational diagnostics, autonomous architecture navigation, and autonomous operational problem placement across AI systems, autonomous systems, robotics, industrial automation, cyber-physical systems, Human-AI environments, and future autonomous ecosystems.

ASGA™ consists of **10 Parent Standards** and **50 Core Modules** .

Additional standards and modules may be added when new governable autonomous operational spaces are identified. However, the standards and modules listed below form the core structural backbone of ASGA™ .

1. Autonomous Identity Standard (AIS)

Governed Space: Autonomous Operational Identity

Core Question: Who is the autonomous operational actor?

Modules:

- Autonomous Identity Verification Module
- Autonomous Identity Attribution Module
- Autonomous Identity Continuity Module
- Autonomous Identity Lifecycle Module
- Autonomous Identity Trust Module

2. Autonomous Authority Standard (AAS)

Governed Space: Autonomous Operational Authority

Core Question: Who has authority to perform autonomous operations?

Modules:

- Operational Authority Assignment Module
 - Operational Authority Delegation Module
 - Operational Authority Validation Module
 - Operational Authority Restriction Module
 - Operational Authority Revocation Module
-

3. Autonomous Execution Standard (AES)

Governed Space: Autonomous Execution

Core Question: What autonomous actions may be executed?

Modules:

- Execution Authorization Module
 - Operational Tool Governance Module
 - Execution Boundary Module
 - Runtime Execution Monitoring Module
 - Safe Execution Termination Module
-

4. Autonomous Constraint Standard (ACS)

Governed Space: Autonomous Operational Constraints

Core Question: Which operational constraints may never be violated?

Modules:

- Operational Constraint Definition Module
 - Operational Constraint Enforcement Module
 - Policy Constraint Module
 - Safety Constraint Module
 - Constraint Exception Governance Module
-

5. Autonomous Risk & Trust Standard (ARTS)

Governed Space: Autonomous Operational Risk & Trust

Core Question: What level of operational risk and trust is acceptable?

Modules:

- Operational Risk Classification Module
 - Operational Trust Evaluation Module
-

- Trust Degradation Module
 - Trust Recovery Module
 - Operational Risk Escalation Module
-

6. Autonomous Coordination Standard (ACOS)

Governed Space: Autonomous Operational Coordination

Core Question: How do autonomous systems coordinate operations?

Modules:

- Autonomous Coordination Module
 - Operational Synchronization Module
 - Shared Objective Coordination Module
 - Operational Conflict Resolution Module
 - Coordination Integrity Module
-

7. Autonomous Escalation Standard (AEES)

Governed Space: Autonomous Operational Escalation

Core Question: When and how should autonomous operation escalate?

Modules:

- Escalation Trigger Module
 - Escalation Authority Module
 - Escalation Continuity Module
 - Human Override Module
 - Escalation Audit Module
-

8. Autonomous Operational Accountability Standard (AOAS)

Governed Space: Autonomous Operational Accountability

Core Question: How is accountability preserved throughout autonomous operation?

Modules:

- Operational Accountability Attribution Module
 - Operational Accountability Continuity Module
 - Operational Accountability Evidence Module
 - Operational Accountability Validation Module
 - Operational Accountability Traceability Module
-

9. Autonomous Compatibility Standard (ACPS)

Governed Space: Autonomous Operational Compatibility

Core Question: How do autonomous systems remain operationally compatible?

Modules:

- Operational Interoperability Module
- Protocol Compatibility Module
- Cross-System Trust Module
- Governance Compatibility Module
- Compatibility Validation Module

10. Autonomous Evolution Standard (AEVS)

Governed Space: Autonomous Evolution

Core Question: How may autonomous systems evolve while remaining governable?

Modules:

- Evolution Authorization Module
- Self-Modification Governance Module
- Evolution Traceability Module
- Evolution Validation Module
- Evolution Auditability Module

ASGA™ Architecture Summary

Parent Standards: 10

Core Modules: 50

Core Governed Spaces

- Autonomous Operational Identity
- Autonomous Operational Authority
- Autonomous Execution
- Autonomous Operational Constraints
- Autonomous Operational Risk & Trust
- Autonomous Operational Coordination
- Autonomous Operational Escalation
- Autonomous Operational Accountability

- Autonomous Operational Compatibility
- Autonomous Evolution

ASGA™ Navigation Layer

Core Questions Map

AIS → Who is the autonomous operational actor?

AAS → Who has authority to perform autonomous operations?

AES → What autonomous actions may be executed?

ACS → Which operational constraints may never be violated?

ARTS → What level of operational risk and trust is acceptable?

ACOS → How do autonomous systems coordinate operations?

AESS → When and how should autonomous operation escalate?

AOAS → How is accountability preserved throughout autonomous operation?

ACPS → How do autonomous systems remain operationally compatible?

AEVS → How may autonomous systems evolve while remaining governable?

Architectural Position

ASGA™ governs the complete autonomous operational lifecycle.

The architecture progresses:

Autonomous Identity → **Autonomous Authority** → **Autonomous Execution** →
Autonomous Constraints → **Autonomous Risk & Trust** → **Autonomous**
Coordination → **Autonomous Escalation** → **Autonomous Operational**
Accountability → **Autonomous Compatibility** → **Autonomous Evolution**

Together these standards govern how autonomous systems establish identity, receive authority, execute operations, remain within operational constraints, manage operational risk, coordinate with other systems, escalate exceptional situations, preserve accountability, maintain compatibility, and evolve while remaining continuously governable throughout autonomous operation.

Canonical Principle

ASGA™ does not govern what autonomous systems are intended to achieve. ASGA™ governs how autonomous operation itself remains identifiable, authorized, constrained, trustworthy, coordinated, accountable, compatible, evolvable, and continuously governable before, during, and after autonomous execution.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.
