

AVOIM — Authority Validation Origin Integrity Module

OriginID: OOF-OID-AGA-AVOIM-2026-06-14-0016

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Validation Governance Layer

Governed Space: Authority Validation Origin Integrity

Category: Governance & Enforcement

Subcategory: Authority Validation Governance

Type: Authority Validation Standard Module

Parent Standard: Authority Validation Standard (AVS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Validation Standard (AVS) · Authority Governance Standard (AGS) ·

Authority Delegation Standard (ADS) · Relationship Accountability Standard (RAS) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Validation Origin Integrity Module (AVOIM) defines the structural conditions under which authority validation remains attributable to an identifiable, legitimate, traceable, governable, accountable, and operationally valid validation source throughout the validation lifecycle.

AVOIM governs validation origin.

The module establishes the integrity conditions required to determine who performed the validation, under what authority the validation was performed, and whether the validation source itself remains legitimate.

Module Operational Role

AVOIM defines the validation-origin governance layer of AVS.

Its role is to preserve visibility of the source responsible for validating authority claims, permissions, certifications, approvals, privileges, and governance rights.

Module Operational Space

AVOIM governs:

- validation origin
- validation-source identification
- validation attribution
- validation-source legitimacy
- validation provenance
- validation accountability
- validator traceability
- authority-validation source governance

The module applies wherever governance requires reconstruction of validation origins.

Module Function

The module applies wherever systems must preserve:

- identifiable validation sources
- traceable validation activities
- reconstructable validation history
- accountable validation processes
- governance-valid validation attribution
- operationally valid validation provenance

Its function is to ensure that governance can determine who validated authority and under what legitimacy the validation occurred.

Minimum Implementation Framework

1. Define the Validation Origin Object

The organization must define which authority-validation environments require origin governance.

This may include:

- certification bodies
- regulatory authorities
- supervisory structures
- organizational governance systems
- contractor qualification systems
- AI governance frameworks
- orchestration environments
- Human-AI governance structures

2. Define Validation Origin Conditions

The system must define the conditions under which validation origin remains valid.

This includes:

- source-identification requirements
- attribution requirements
- traceability requirements
- accountability requirements
- legitimacy requirements
- governance-valid origin conditions

3. Define Origin Degradation Detection Logic

The system must define how validation-origin failures are identified.

This may include:

- unidentified validators
- illegitimate validation sources
- undocumented validation activities
- unverifiable validation origin
- governance-blind validation
- fraudulent validation claims

4. Define Operational Response or Governance Logic

The system must define governance logic for validation-origin failures.

Governance response may include:

- source verification
- validation review
- governance intervention
- escalation
- validation reconstruction
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- validation sources
- validation decisions
- validation reviews
- governance interventions
- corrective actions
- resulting validation states

An authority-validation environment must not remain origin-valid if materially significant validation activities cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Certification Environment

Scenario

An organization relies on a certification body to validate qualifications required for operational activities.

Application

AVOIM determines who performed the validation and whether the validating authority remains legitimate.

Result

Governance gains visibility into the source of validation and its legitimacy.

Use Case 2 — AI Governance Environment

Scenario

An orchestration system validates authority assignments granted to supervisory agents operating within a distributed AI environment.

Application

AVOIM reconstructs the source responsible for validating authority privileges.

Result

Governance gains visibility into the origin of authority validation across intelligent operational systems.

Canonical Closing Statement

Authority Validation Origin Integrity Module (AVOIM) defines the structural conditions under which authority validation remains attributable to an identifiable, legitimate, traceable, governable, accountable, and operationally valid validation source throughout the validation lifecycle.

Authority validation cannot remain trustworthy if the source of validation cannot be identified. Authority validation origin integrity therefore becomes a foundational condition of trustworthy
