

AVVIM — Authority Validation Validity Integrity Module

OriginID: OOF-OID-AGA-AVVIM-2026-06-14-0018

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Authority Validation Governance Layer

Governed Space: Authority Validation Validity Integrity

Category: Governance & Enforcement

Subcategory: Authority Validation Governance

Type: Authority Validation Standard Module

Parent Standard: Authority Validation Standard (AVS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Authority Validation Standard (AVS) · Authority Governance Standard (AGS) ·

Authority Delegation Standard (ADS) · Authority Escalation Standard (AES) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Authority Validation Validity Integrity Module (AVVIM) defines the structural conditions under which authority validation remains legitimate, recognized, enforceable, governable, accountable, reconstructable, and operationally valid throughout the validation lifecycle.

AVVIM governs validation validity.

The module establishes the integrity conditions required to determine whether a validation outcome itself remains valid, recognized, current, enforceable, and operationally reliable.

Module Operational Role

AVVIM defines the validation-validity governance layer of AVS.

Its role is to ensure that validation outcomes remain trustworthy after validation has occurred.

Module Operational Space

AVVIM governs:

- validation validity
- validation legitimacy
- validation recognition
- validation enforceability
- validation lifecycle governance
- validation status management
- authority-recognition continuity
- validation accountability

The module applies wherever governance requires confirmation that validation outcomes remain valid over time.

Module Function

The module applies wherever systems must preserve:

- legitimate validation outcomes
- recognized authority status
- reconstructable validation history
- accountable validation decisions
- governance-valid authority recognition
- operationally reliable validation states

Its function is to ensure that governance can determine whether previously validated authority remains valid today.

Minimum Implementation Framework

1. Define the Validation Validity Object

The organization must define which validation environments require validity governance.

This may include:

- certification systems
- licensing environments
- governance appointments
- supervisory authorizations
- contractor qualification systems
- AI authorization frameworks
- agent-permission environments
- Human-AI governance systems

2. Define Validation Validity Conditions

The system must define the conditions under which validation

remains valid.

This includes:

- validity requirements
- renewal requirements
- recognition requirements
- accountability requirements
- governance requirements
- validation-maintenance conditions

3. Define Validity Degradation Detection Logic

The system must define how validation-validity failures are identified.

This may include:

- expired validations
- revoked authority
- suspended authority
- invalid certifications
- governance-invalid approvals
- obsolete authority recognition

4. Define Operational Response or Governance Logic

The system must define governance logic for validation-validity failures.

Governance response may include:

- validation review
- revalidation procedures
- governance intervention
- escalation
- suspension of authority
- corrective actions
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- validation outcomes
- renewal activities
- revalidation decisions
- governance reviews
- intervention procedures
- resulting validation states

An authority-validation environment must not remain validity-valid if materially significant validation outcomes cannot be reconstructed, reviewed, renewed, validated, or governed.

Use Case 1 — Professional Certification

Environment

Scenario

A worker possesses a certification granting authority to perform specialized operational activities.

Application

AVVIM governs whether the certification remains valid, current, recognized, and enforceable.

Result

Governance gains visibility into the continuing validity of authority.

Use Case 2 — AI Authority Environment

Scenario

An AI agent receives validated authority to access tools, workflows, operational privileges, or execution systems.

Application

AVVIM governs whether the validation remains current and operationally valid throughout the authorization lifecycle.

Result

Governance gains visibility into whether authority remains valid after initial approval.

Canonical Closing Statement

Authority Validation Validity Integrity Module (AVVIM) defines the structural conditions under which authority validation remains legitimate, recognized, enforceable, governable, accountable, reconstructable, and operationally valid throughout the validation lifecycle.

Validation is not a one-time event. Authority validation validity integrity therefore becomes a foundational condition of trustworthy
