

Audit Observation Attribution Module (AOAM™)

OOF™ Origin Open Foundation™

Independent Methodological Authority

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: ADIT® — Continuous Audit & Evidence Governance Architecture

Parent Standard: Audit Observation Standard (AOS™)

Operational Layer: Audit Observation Governance Layer

Category: Governance & Enforcement

Subcategory: Audit & Evidence Governance

Type: Parent Standard Module

Governed Space: Audit Observation Attribution

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™ · RIS™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Audit Observation Attribution

Canonical Definition

Audit Observation Attribution Module (AOAM™) defines the governance framework for identifying, assigning, validating, and preserving the attribution of every audit observation to its originating entity, responsible actor, autonomous agent, system component, operational process, authority source, or observation mechanism. It establishes attribution principles, identification requirements, attribution relationships, validation controls, governance rules, and traceability requirements necessary to ensure that every governed audit observation remains objectively attributable throughout the complete lifecycle of a governed entity.

Operational Role

AOAM governs the attribution layer of audit observation by ensuring that every governed observation is accurately associated with its operational origin, responsible entities, governing authority, and observation source before evidence formation begins.

Minimum Implementation Framework

1. Define Attribution Requirements

Identify the entities, actors, autonomous agents, systems, processes, authorities, identities, and observation mechanisms that must be attributable for every governed audit observation.

2. Define Attribution Methodology

Establish standardized methods for assigning, recording, maintaining, validating, and preserving attribution relationships across all governed operational environments.

3. Define Attribution Validation Logic

Define how attribution accuracy, completeness, authenticity, consistency, traceability, and governance conformity are verified before an observation becomes eligible for evidence formation.

4. Define Governance Response

Establish governance actions for missing attribution, conflicting attribution, unidentified sources, unauthorized attribution changes, attribution failures, and corrective actions where required.

5. Preserve Attribution Records

Maintain attribution records, responsible entities, authority relationships, source identifiers, validation results, timestamps, governance decisions, and supporting documentation throughout the complete lifecycle.

Example Use Cases

Use Case 1 — Autonomous AI Governance

Scenario

Multiple autonomous AI agents collaboratively execute a complex operational workflow involving delegated authority and distributed decision-making.

Application

AOAM governs the attribution of every observed decision, action, delegation, authority activation, and operational outcome to the correct autonomous agent, responsible authority, and observation source.

Result

Every audit observation remains objectively attributable, fully traceable, and suitable for trustworthy evidence formation and independent audit.

Use Case 2 — Financial Services

Scenario

A digital banking platform processes high-value financial transactions involving customers, automated fraud detection systems, and internal approval workflows.

Application

AOAM governs the attribution of every observed transaction, approval, intervention, automated decision, and governance action to the appropriate identities, operational systems, and responsible authorities.

Result

Financial audit observations maintain complete attribution integrity, enabling transparent accountability, evidence traceability, and reliable audit reconstruction.

Canonical Closing Statement

Audit Observation Attribution Module establishes the canonical governance framework for assigning, validating, preserving, and governing attribution throughout the audit observation lifecycle. By ensuring that every governed observation remains objectively linked to its operational origin, responsible entities, governing authority, and observation source, AOAM enables trustworthy evidence formation, continuous auditability, accountable governance, and independent verification throughout the complete lifecycle of every governed entity.

OOF® MIP® Protection Notice
