

About Evidence Verification Standard - (EVS)

Understanding Evidence Verification Standard

What Is Evidence Verification Standard?

Evidence Verification Standard is the fifth Parent Standard of ADIT® — Continuous Audit & Evidence Governance Architecture™. It governs how correlated evidence is objectively verified before it is accepted for audit execution, governance decisions, regulatory review, legal proceedings, or independent verification.

Evidence Verification Standard recognizes that authentic, complete, preserved, and properly correlated evidence is not automatically verified. Before evidence can support audit conclusions or governance decisions, it must be objectively evaluated against defined verification criteria.

Canonical Definition

Evidence Verification Standard defines the governance conditions required to verify the accuracy, validity, reliability, authenticity, completeness, consistency, and sufficiency of correlated evidence before it is used for audit execution. It establishes verification principles, validation requirements, verification controls, governance mechanisms, and continuous verification assurance necessary to determine whether governed evidence satisfies the required level of trust for audit, investigation, operational reconstruction, and independent verification.

Why Evidence Verification Standard Exists

Reliable audit depends on verified evidence rather than assumed evidence.

Organizations need a standardized methodology to determine whether evidence satisfies objective governance requirements before it is used to support findings, decisions, accountability, or regulatory actions.

Evidence Verification Standard exists to ensure that only evidence meeting defined verification criteria proceeds to audit execution.

What Evidence Verification Standard Governs

Evidence Verification Standard governs:

- Evidence verification
 - Evidence validation
 - Evidence reliability
 - Evidence sufficiency
 - Verification methodology
-

- Verification decisions
- Verification assurance

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform produces correlated evidence documenting thousands of operational decisions across distributed intelligent systems.

Application

Evidence Verification Standard governs the objective verification of the correlated evidence before it is accepted for audit execution and governance oversight.

Result

Only verified evidence is used to support audit conclusions, accountability, operational reconstruction, and independent verification.

Use Case 2 — Regulatory Investigation

Scenario

A regulatory authority receives evidence from multiple organizations during a formal compliance investigation.

Application

Evidence Verification Standard governs the verification of the submitted evidence by evaluating its reliability, completeness, consistency, authenticity, and sufficiency before regulatory decisions are made.

Result

Regulatory decisions are supported by objectively verified evidence rather than assumptions or unverified information.

Architectural Position

Evidence Verification Standard represents the fifth governed space within ADIT® — Continuous Audit & Evidence Governance Architecture™, serving as the formal gateway between evidence governance and audit execution.

Governance Flow

Audit Observation → Evidence Formation → Evidence Integrity → Evidence Correlation → Evidence Verification → Audit Execution → Audit Findings → Audit

Canonical Closing Statement

Evidence Verification Standard establishes the canonical governance framework for objectively verifying governed evidence before audit execution. By governing evidence verification, validation methodology, reliability assessment, sufficiency evaluation, and continuous verification assurance, Evidence Verification Standard enables reliable audit, operational reconstruction, accountable governance, and independent verification across all operational domains.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property
