

Evidence Correlation Standard

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-ADIT-ECS-2026-07-26-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: ADIT® — Continuous Audit & Evidence Governance Architecture

Operational Layer: Evidence Correlation Governance Layer

Category: Governance & Enforcement

Subcategory: Audit & Evidence Governance

Type: Parent Standard

Governed Space: Evidence Correlation

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 26 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™ · RIS™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Evidence Correlation

Core Question

How can independently governed evidence be accurately related, connected, and analyzed to reconstruct operational reality without compromising its integrity?

Canonical Definition

Evidence Correlation Standard defines the governance conditions required to establish, validate, manage, and preserve relationships between multiple governed evidence objects. It establishes evidence correlation principles, relationship rules, dependency validation, contextual linkage, correlation governance, and continuous correlation assurance necessary to reconstruct operational reality from trustworthy evidence throughout the complete lifecycle of a governed entity.

Governance Flow Position

Audit Observation → Evidence Formation → Evidence Integrity → Evidence Correlation → Evidence Verification → Audit Execution → Audit Findings → Audit

Standard Abstract

Individual evidence objects rarely provide a complete understanding of operational reality.

Reliable audit requires multiple evidence objects to be accurately connected through governed relationships, contextual dependencies, chronological sequences, operational links, and causal associations.

Evidence Correlation Standard transforms individually trustworthy evidence into a coherent and governable representation of operational reality without modifying the evidence itself.

Operational Role

Evidence Correlation Standard governs the relationship layer of evidence governance by establishing how independently governed evidence is connected, contextualized, sequenced, and analyzed before verification and audit execution.

Operational Space

Evidence Correlation Standard governs:

- evidence relationships
 - evidence linkage
 - contextual association
 - chronological correlation
 - dependency mapping
 - causal relationships
 - evidence network integrity.
-

Why This Standard Exists

Trustworthy evidence may still fail to explain what actually happened if individual evidence objects remain isolated.

Organizations require a standardized methodology for connecting evidence into a coherent operational narrative while preserving the integrity of every individual evidence object.

Evidence Correlation Standard exists because Evidence Correlation represents the fourth governed space of ADIT® — Continuous Audit & Evidence Governance Architecture™, enabling reliable reconstruction of operational reality before evidence verification begins.

Scope

This standard may be applied across:

- AI systems
- autonomous systems
- digital identities
- cybersecurity
- financial systems
- healthcare
- industrial operations
- critical infrastructure
- regulatory compliance
- digital forensics
- operational governance
- and any governed environment requiring evidence correlation.

Relationship to Other OOF® Architectures

Evidence Correlation Standard interoperates with:

- GOA™
- OBIDENTITY®
- INTEGROS®
- ORA™
- AGA™
- AIG®
- CLIA®
- MGIA™
- ASGA™
- RIS™

by providing the canonical methodology for governing relationships between trustworthy evidence across operational domains.

Foundational Principle

Trustworthy evidence becomes operationally meaningful only when its relationships are governed.

Canonical Closing Statement

Evidence Correlation Standard establishes the canonical governance framework for relating independently governed evidence into coherent representations of operational reality. By governing evidence relationships, contextual linkage, dependency mapping, chronological sequencing, and correlation assurance, the standard enables reliable audit, operational reconstruction, accountable governance, and independent verification across all operational domains.
